“Quantitative Problems, Workshop II”

OVERVIEW
DROUGHT PLANNING AND MANAGEMENT IN SPAIN

IV Europe-INBO meeting
21st September 2006  Megeve, France

Teodoro Estrela
Deputy Water Director
Spanish Ministry of Environment
Quantitative problems

- Scarcity and droughts are becoming a major socio-economic problem of European dimension: urban supply, agriculture, environmental needs being affected.

- Water Framework Directive: takes into account prolonged droughts, but does not specify measures. MS need to have a common approach and share solutions when approaching scarcity.
Management alternatives for droughts

a) As emergency situation
   Considering it as a crisis situation, which has to be tackled using extraordinary resources.

b) Within the general planning framework
   Making an analysis of the existing risk, and introducing droughts in the general planning strategies as a different scenario.

In Spain, traditionally, droughts have been managed as emergency situations.
Drought management as emergency situation

Spanish Water Law (TRLA), in art. 58, foresees in extraordinary drought situation the adoption, by the Government, of necessary measures to overcome these situations, related to the use of the public water domain.

Specific decrees of urgent extraordinary measures.
Law 10/2001, July 5, of the Hydrological Water Plan, establishes the bases for the drought planned management.

Article 27. Drought management
Section 1. The Ministry of Environment, for the intercommunitary basins, in order to minimize environmental, economic and social impacts of eventual drought situation, will establish a global hydrologic indicators system that will allow foreseeing these situations, and will serve as general reference for river basin organizations for the formal declaration of emergency situations and eventual drought. This declaration will imply the entry into force of the Special Plan referred in the following section.
Bases for drought planned management

Hydrological National Plan Article 27. Drought management

Section 2. **Basin Organizations** will develop (in 2 years) **special action plans** for alert situations and **eventual drought** (exploitation rules and measures).

Hydrological National Plan Article 27. Drought Management

Point 3. **Public Administrations responsible** for public urban supplying, for town of or above **20,000 inhabitants**, will provide: **Emergency Plan for drought** situations (taking into account rules and measures planned in Special Plans) to be applied within four years.
Current drought (2004 - ?)

- The current drought started at the beginning of the 2004 hydrologic year, continuing throughout all Spanish territories during the present hydrologic year.

- Currently droughts are mainly affecting the following areas: Guadiana river head, the Júcar and Segura river basins, and some areas of the Tajo and Guadalquivir.

*Date: 30 June 2006*

*Notes:*
1. Color codes table indicates the various levels of hydrologic status.
2. "Pre-Alert" indicates an imminent threat.
3. "Alert" signifies immediate action is required.
Special drought plan

Objective

Anticipate to droughts, foreseeing solutions to supply demand and comply with environmental requirements.

Bases for the Special Drought Plan. Plans must be based on:

a) Knowledge of the resources system and its elements capacity to be forced in scarcity situation.

b) Knowledge of the demands system and its vulnerability against droughts
c) Indicators system for identifying drought situations.
d) Application of measures to reduce drought impact according to the indicators status
e) Adaptation of the administrative structure for its follow-up and coordination among involved administrations.
f) Plan for public information

Status

Special Drought Plans are being finished by the river basin organizations.
Main measures to apply during drought situation

- Exploitation rules, savings and use restrictions
- Joint management of surface water and groundwater: drought wells
- Non-conventional resources: reuse of treated wastewaters in agriculture
- Water markets.

Use of models to define exploitation rules and use restrictions

Emergency measures: use of drought wells
Emergency Urban Supply Plans > 20000 hab.

**Objective**
Management of droughts to guarantee population supply

**Bases of the Emergency Plan**
- Assessment system and control of non-supply risk
- Application of measures according to indicators statuses
- Demand management
- Supply actions
EC: Water Scarcity and Droughts
Working Group

- Group co-led by EC, France, Italy and Spain.
- Objectives: to determine how member states can comply with WFD under scarcity and drought events and establish a common strategy.
- Currently working on document that gathers situation on most affected countries to be presented to Water Directors in December meeting.

Initial priorities agreed by WD

Working Groups – work programme and deliverables to be decided

Other activities – structure, organisation, work programme and deliverables to be decided

Status: 02.06.2006
