

SAID Monitoring network

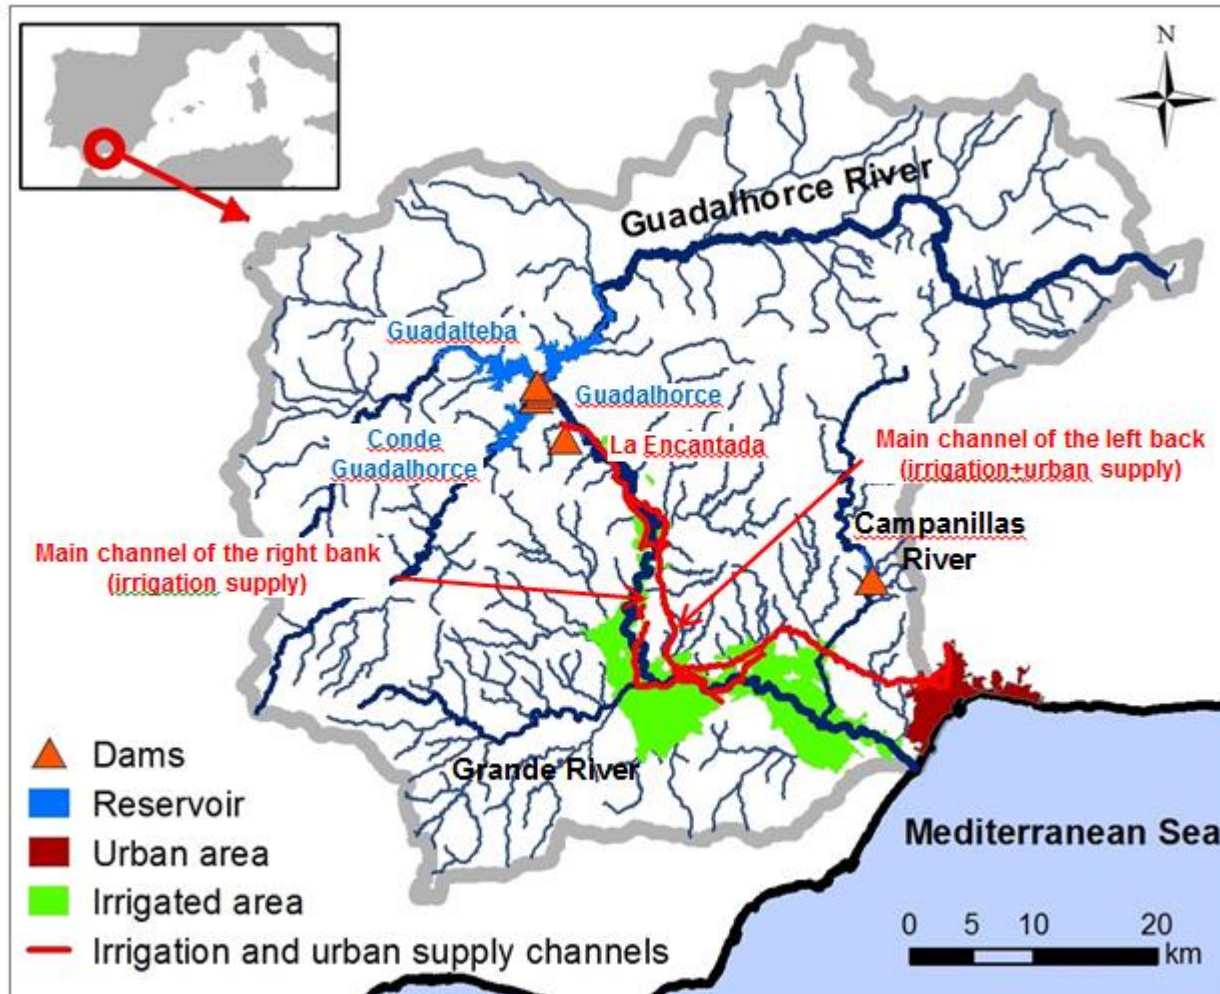

Antonio Hayas López
Abengoa Water

Lourdes, 19th October 2016

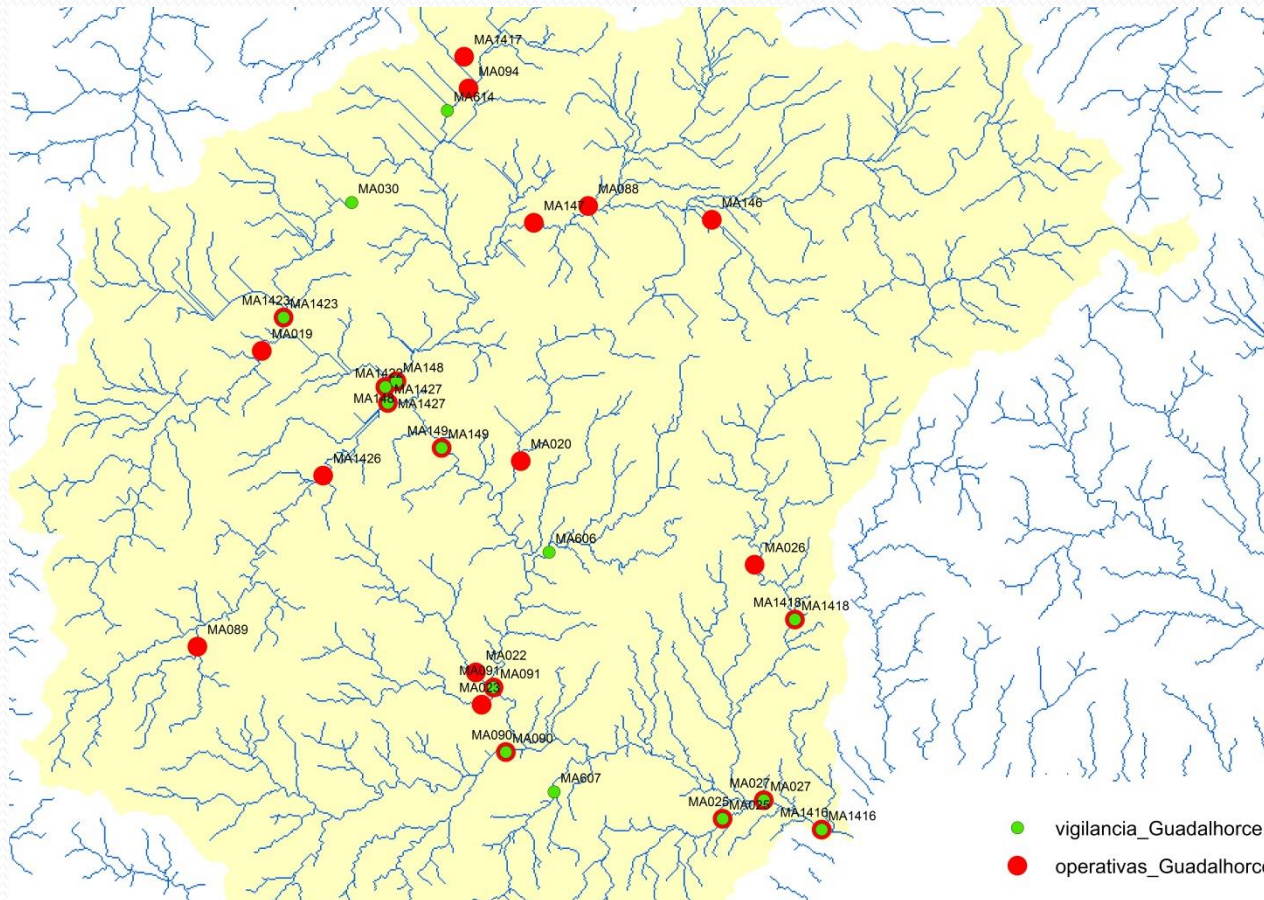

Co-funded by the seventh framework programme (FP7), under grant agreement no. 619132, within the Water Inno & Demo-1

SAID demonstrator area

Previous monitoring networks

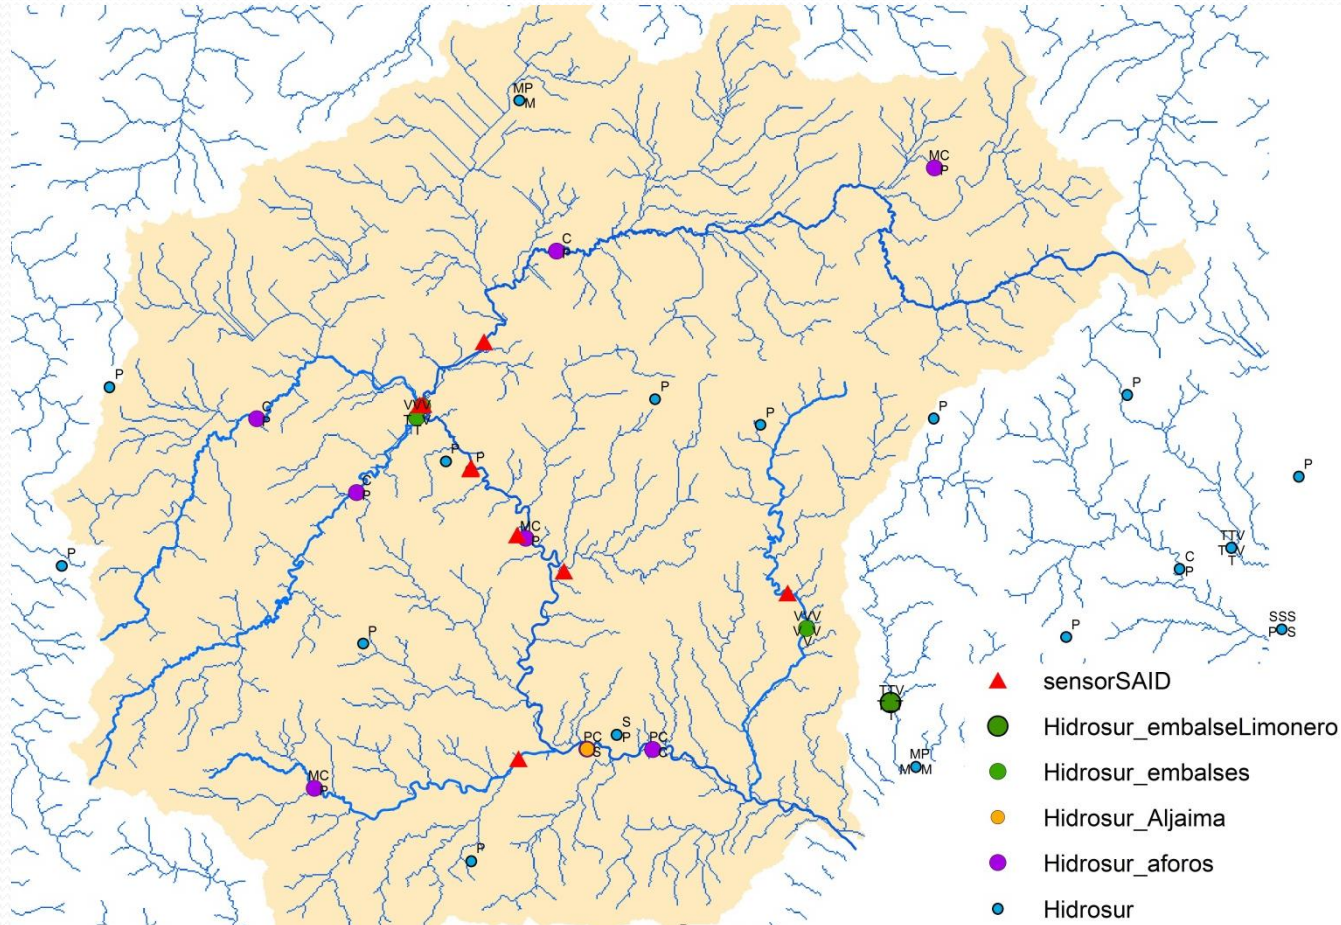

Water quality data from Consejería

Co-funded by the seventh framework programme (FP7), under grant agreement no. 619132, within the Water Inno & Demo-1

Previous monitoring networks

Rainfall and water flow data from Hidrosur

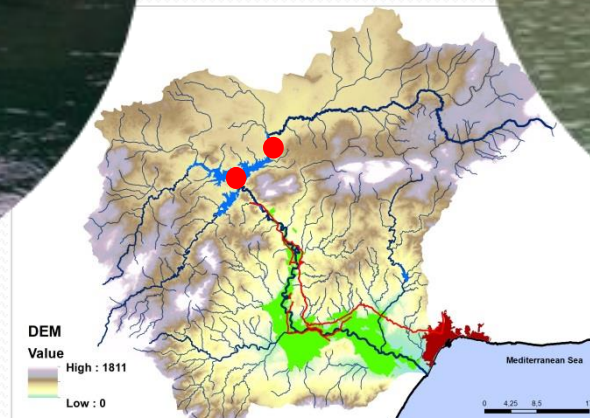

Co-funded by the seventh framework programme (FP7), under grant agreement no. 619132, within the Water Inno & Demo-1

SAID sensors: Control in reservoirs

Guadalhorce reservoir (Water quantity and quality)

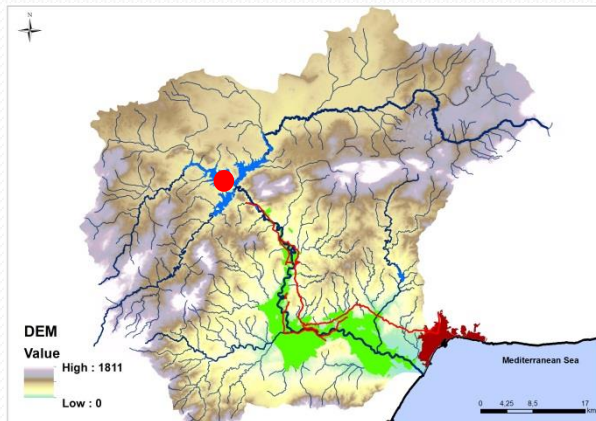

depth, conduct., temp., pH, Dis.Ox., redox

SAID sensors: Control in reservoirs

Guadalteba reservoir (Water quantity and quality)

depth, conduct., temp., pH, Dis.Ox., redox

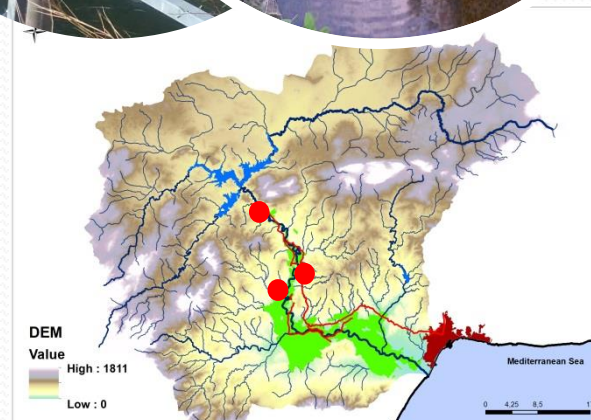

SAID sensors: Control in channels

Channel downstream La Encantada dam (Water quantity and quality)

Channel for irrigation supply (Water quality)

Channel for irrigation + urban supply (Water quantity and quality)

SAID sensors: Control in rivers

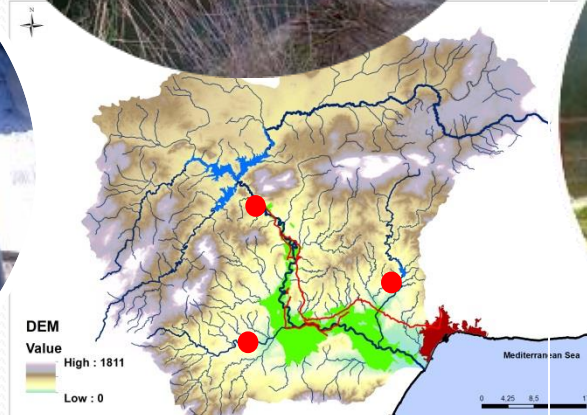

Guadalhorce River (Environmental flow)

Grande River (Flood)

Campanillas River (Flood)

SAID Communication network

Example of
IHP Node

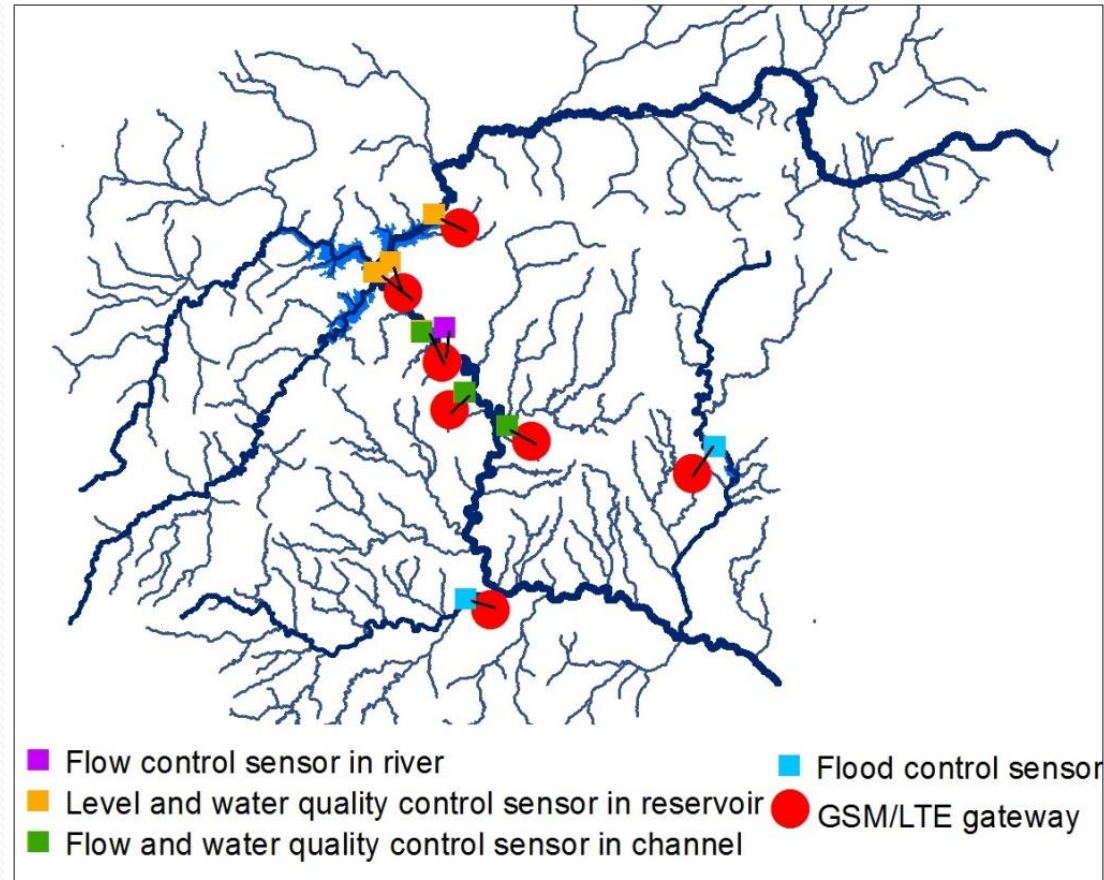

- An **IHP node** collects data from **environmental sensors** and sends readings to a sink (another IHP node)
- The **sink node** forwards data to a **GSM/LTE Gateway** connected to Internet
- The **gateways** send their data to the **IHP server (via Internet)**
- **IHP server** passes data to the **DSS server** which supplies inputs to DSS in the expected formats and time rates

* IHP nodes draw only a few mA, leading to long lifetime (months, years)

Final SAID network

- Sensor data gathered from seven locations.
- Sensor nodes collect data and forward to the GSM gateway, and to the internet.
- Selected 868 MHz frequency band for wireless communication in each location:
 - ✓ License-free band
 - ✓ Huge TX power available (up to +27 dBm)
- 868 MHz transceiver available on IHP nodes

Conclusions

- Autonomous sensing communication available
 - No infrastructure needed: wireless communication and battery-powered operation
- Easy to add new sensors
 - Based on SDI-12 interface
 - No configuration needed
- Long lifetime
 - Low-power operation
