Lakes Conference

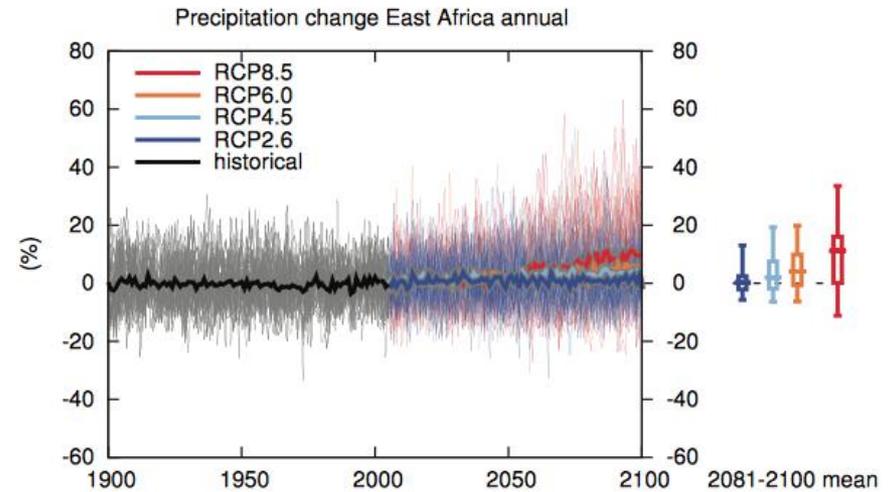

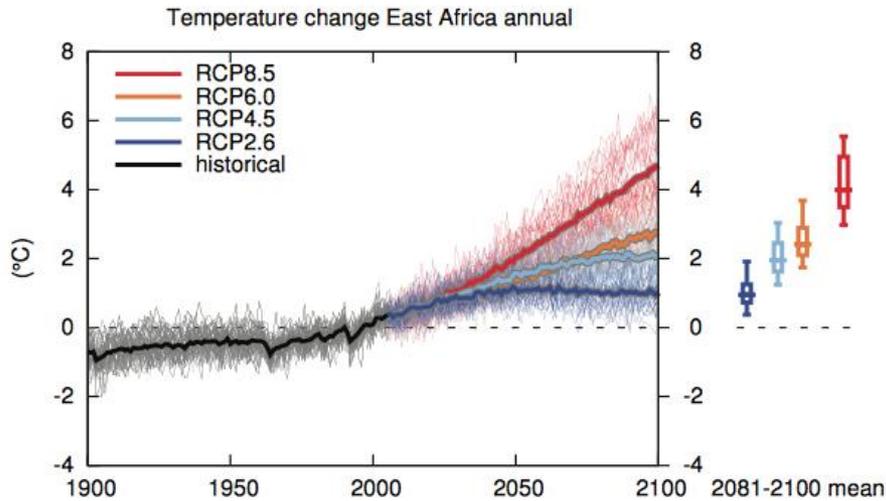

# CONSERVATION STRATEGY FOR THE GREAT LAKES REGION OF EAST AND CENTRAL AFRICA

*BirdLife International & MacArthur Foundation (2012)*

**Actions needed** on climate change for biodiversity conservation and the services biodiversity provides to humanity across the Great Lakes Region.

- ◆ Integrate climate change in all forms of planning.
- ◆ Perform lake-basin scale climate change assessments.
- ◆ Understand the direct impacts climate change has on biodiversity and the biophysical environment
- ◆ Understand the indirect responses from human action.
- ◆ Understand the response of other threats to climate change.
- ◆ Integrate monitoring into planning and vulnerability assessments.
- ◆ Test different adaptation solutions.
- ◆ Undertake 'no regrets' actions now.

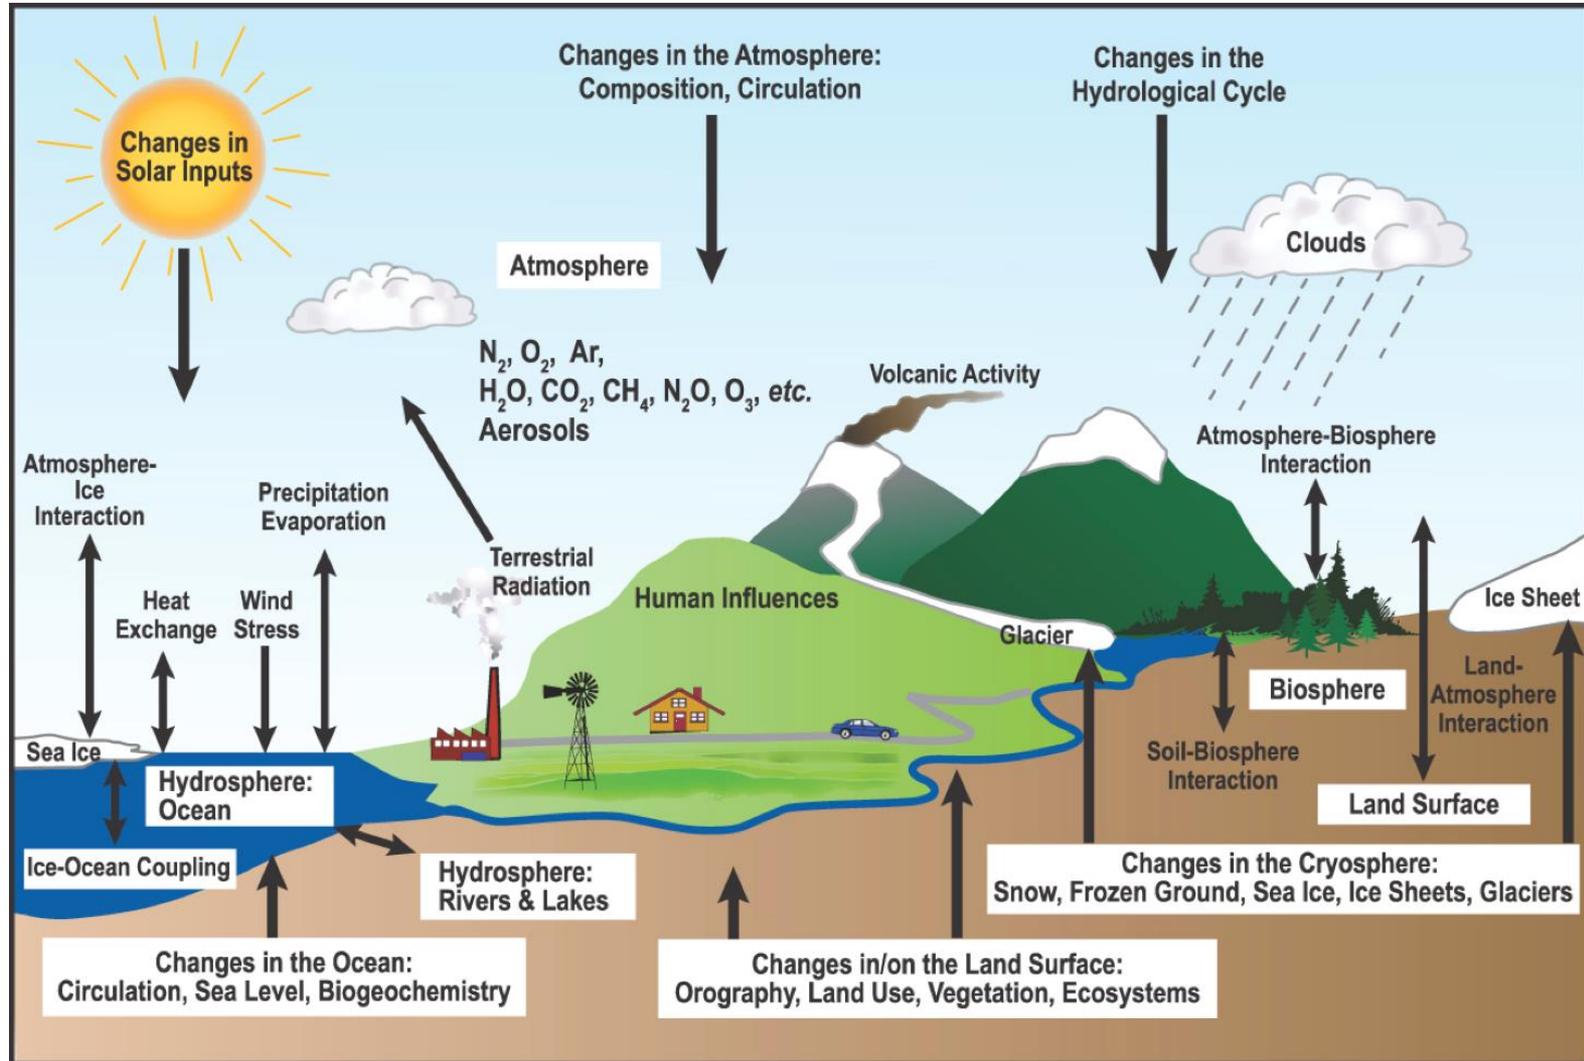

# IPCC Multi-model Projections for East Africa

How do we translate such information into environmental outcomes?

What is the climate change information that stakeholders actually need?

# Earth System processes & feedbacks that govern climatic conditions

Source: NCAR CESM project

# CESM Approach to Modeling Historical and Future Human and Earth Systems

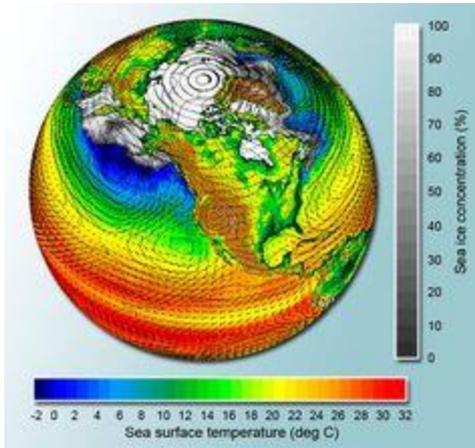

NCAR's Global Human and Earth System Modeling tools show how humans change the Earth System through emissions of greenhouse gases and aerosols, and from changes in surface processes through land use and land cover change.

***Great Lakes Project Interest: Can these global models be used regionally with higher spatial resolution and improved local understanding to evaluate how human activity and climate change are impacting the natural and human systems of the African Rift Valley?***

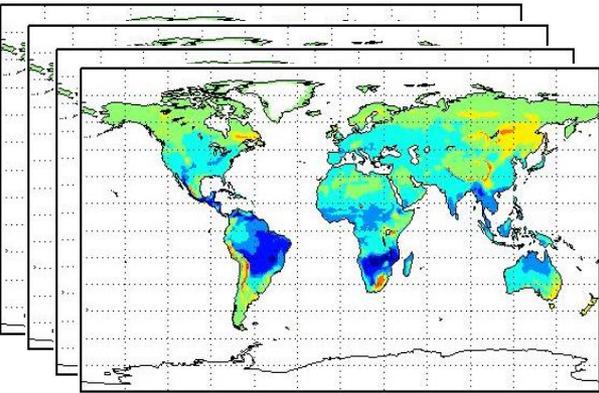

If so, how can they be best utilized to inform Conservation and Resource Management through the region?

# NCAR Global Human and Earth System Modeling

## Watersheds of the African Great Lakes 21<sup>st</sup> Century Changes in High-Stress Climatic Conditions

### Overview

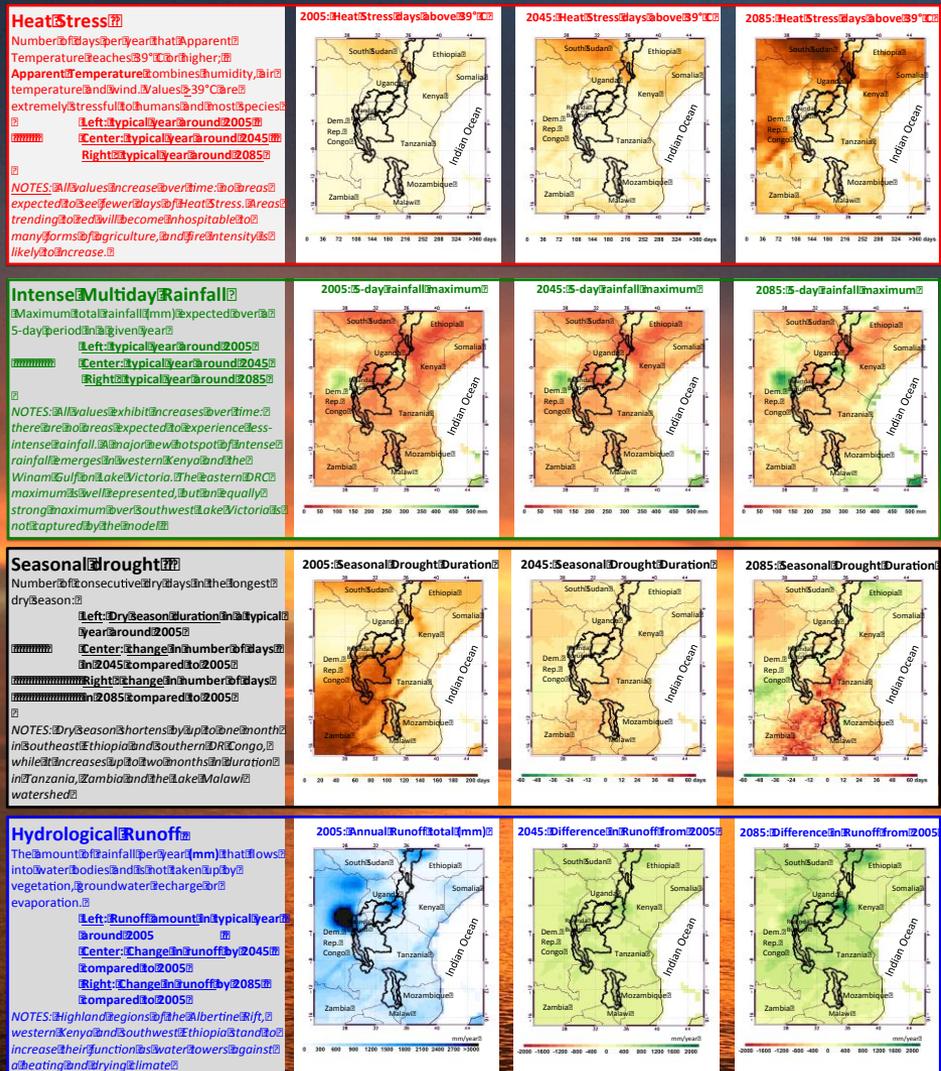

Earth system models integrate physical, chemical and biological processes that determine past, present and future climate. We use the Community Earth System Model (CESM) to generate depictions of environmental futures under climate change for major African Great Lake watersheds. These predictions offer state-of-the-science guidance for a multitude of environmental variables to serve stakeholder planning needs.

Here we demonstrate predictive products that indicate the increasingly stressful climatic conditions likely to occur over coming decades across the lake watersheds, with potentially severe impacts upon natural systems, humanity, agriculture, lake ecology and ecosystem services.

### How to use this information.

We have used the high greenhouse gas and land-use change Representative Concentration Pathways (RCP) 8.5 to examine how climatic extremes and vegetation may develop over coming decades across the Great Lakes watersheds.

The predictions shown here offer just one representation of possible environmental futures for the region, whereby it is important to recognize that other predictions by CESM and other earth system models may show very different results.

# How to use this information

The predictions shown on the poster offer just one representation of possible environmental futures for the region, whereby it is important to recognize that other predictions by CESM and other earth system models may show very different results.

## Intense Multiday Rainfall

Maximum total rainfall (mm) expected over a 5-day period in a given year

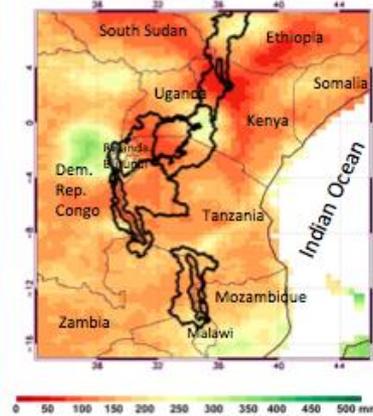

**Left: typical year around 2005**

**Center: typical year around 2045**

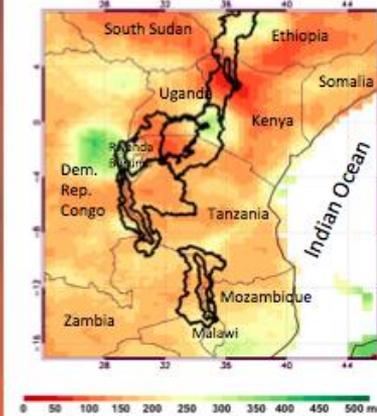

**Right : typical year around 2085**

*NOTES: All values exhibit increases over time: there are no areas expected to experience less-intense rainfall. A major new hotspot of intense rainfall emerges in western Kenya and the Winam Gulf on Lake Victoria. The eastern DRC maximum is well represented, but an equally strong maximum over southwest Lake Victoria is not captured by the model*

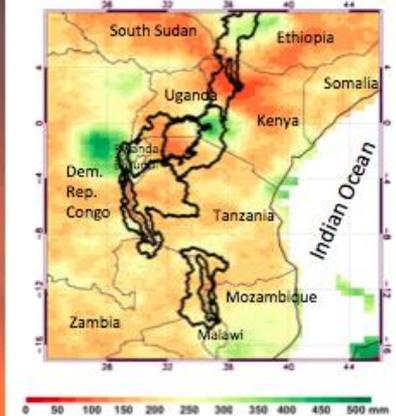

2005: 5-day rainfall maximum

2045: 5-day rainfall maximum

2085: 5-day rainfall maximum

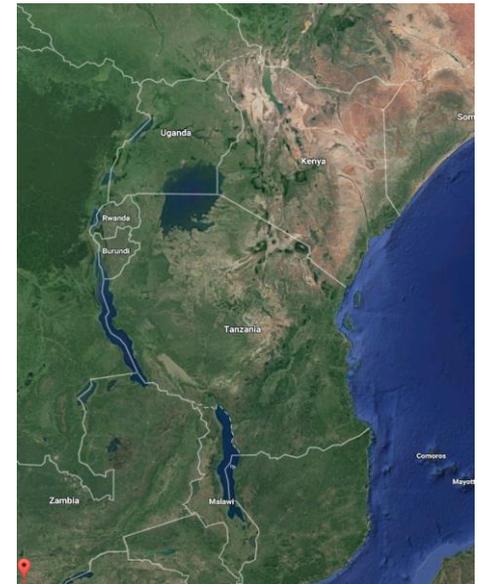

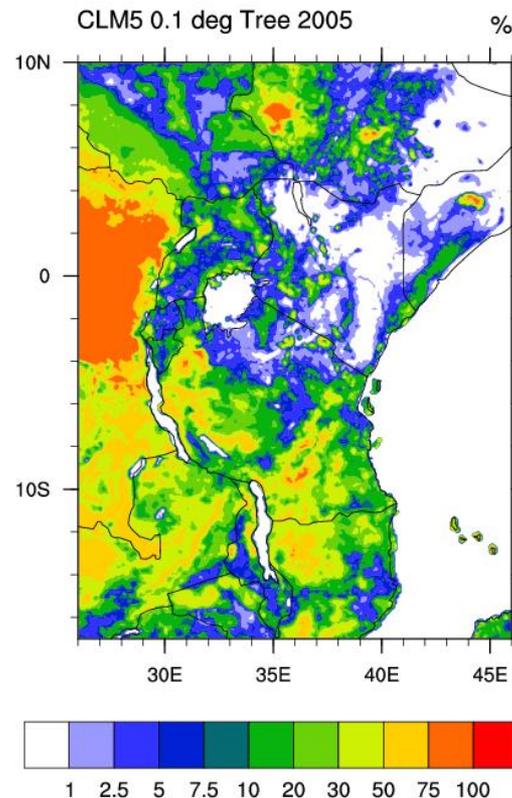

# CLM5 CMIP6 – New Land Surface Descriptions

Global Land Model (GLM): annual time series dynamics of agriculture and forests through changes in 12 land units at 27 km spatial resolution.

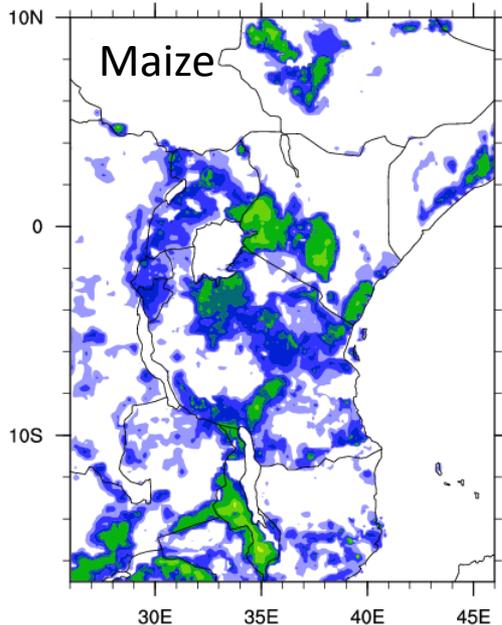

- Primary Forest
- Secondary Forest
- Crop C3 Annual

CLM5 0.1 deg Rice 2005

%

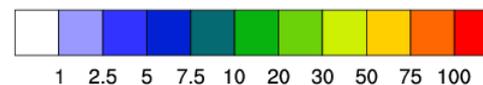

CLM5 0.1 deg Sorghum 2005

%

Percent coverage by crop types in 2005; can be predicted by CESM-CLM for each crop in the future

32 crop types currently considered

# Current work - CESM East Africa Rift Valley Modeling Strategy

Understand how Natural and Human Systems have been, or potentially will be, impacted by:

## 1. Climate, through changes in:

- **Temperature** that impacts vegetation directly through photosynthesis responses, and agriculture through flowering and grain fill, as well as people through heat stress and disease.
- **Precipitation** that impacts surface hydrology and through that vegetation and agriculture through water availability, and streams and lakes through changes in runoff.
- **Relative humidity and wind speed** that impact potential evaporation, the vapor pressure deficit response of vegetation, and fire ignition, intensity and spread.

## 2. Atmospheric CO<sub>2</sub> concentration through changes in:

- **Photosynthesis** through carbon availability, with higher CO<sub>2</sub> resulting in higher productivity.
- **Water use efficiency**, with less water loss for the same carbon uptake.

# Current work - CESM East Africa Rift Valley Modeling Strategy

## 3. Land Cover Change:

- **Deforestation** for agricultural expansion of crops and pastures.
- **Wood harvest** for timber production along with other forest disturbance.
- **Conservation and afforestation** for carbon storage and biodiversity protection.
- **Biofuel production** from forests and crops.

## 4. Land Use Management:

- **Changes in crop production** resulting from cropping area, fertilizer application, irrigation use and crop selection.
- **Changes in carbon storage** in response to crop practices.
- **Changes in water availability** in streams and lakes through irrigation withdrawal and water management.

# East African Rift Valley Shared Socioeconomic Selection

Table 1. Summary of assumptions about demographic factors for five SSPs. Country groupings for factors affecting population growth outcomes (fertility, mortality, migration) are made according to current fertility and income conditions [17], while groupings for urbanization assumptions are made according to current income alone [18].

	SSP1 Sustainability	SSP2 Middle of the road	SSP3 Regional rivalry	SSP4 Inequality	SSP5 Fossil-fueled development
Population Growth					
High fertility	Low	Medium	High	High	Low
Other low fertility	Low	Medium	High	Medium low	Low
Rich low fertility	Medium	Medium	Low	Medium low	High
Urbanization level					
High income	Fast	Central	Slow	Central	Fast
Medium income	Fast	Central	Slow	Fast	Fast
Low income	Fast	Central	Slow	Fast	Fast
Spatial pattern	Concentrated	Historical patterns	Mixed	Mixed	Sprawl

# Great Lakes Region SSP1 & SSP3- Tree cover change

# Current work - Creating a diverse set of environmental predictions

Compare how Natural and Managed systems respond:

- under changing CO<sub>2</sub> and climate
- with and without Land Use and Land Cover Change
- for the Historical and two different Future Climate Scenarios

Specific CESM model runs:

1. 1850 spin up of carbon cycle at 0.1 degrees from global 1850 simulation.

2a. Historical 1850 - 2015 simulation with ramping CO<sub>2</sub> and climate.

2b. Historical 1850 - 2015 simulation with no Land Use Land Cover Change

3a. SSP1 Land Use with RCP4.5 atmospheric conditions 2016 - 2100

3b. SSP3 Land Use with RCP4.5 atmospheric conditions 2016 - 2100

3c. No Land Use (2015 vegetation distribution) with RCP4.5 atm 2016 - 2100

4a. SSP1 Land Use with RCP8.5 atmospheric conditions 2016 - 2100

4b. SSP3 Land Use with RCP8.5 atmospheric conditions 2016 - 2100

4c. No Land User (2015 veg no wood harvest) with RCP 8.5 atm 2016 – 2100.

These outputs will be available to all, can be used to inform decision making
