# The AGL region: 15% of the world's 15,000 freshwater fish species

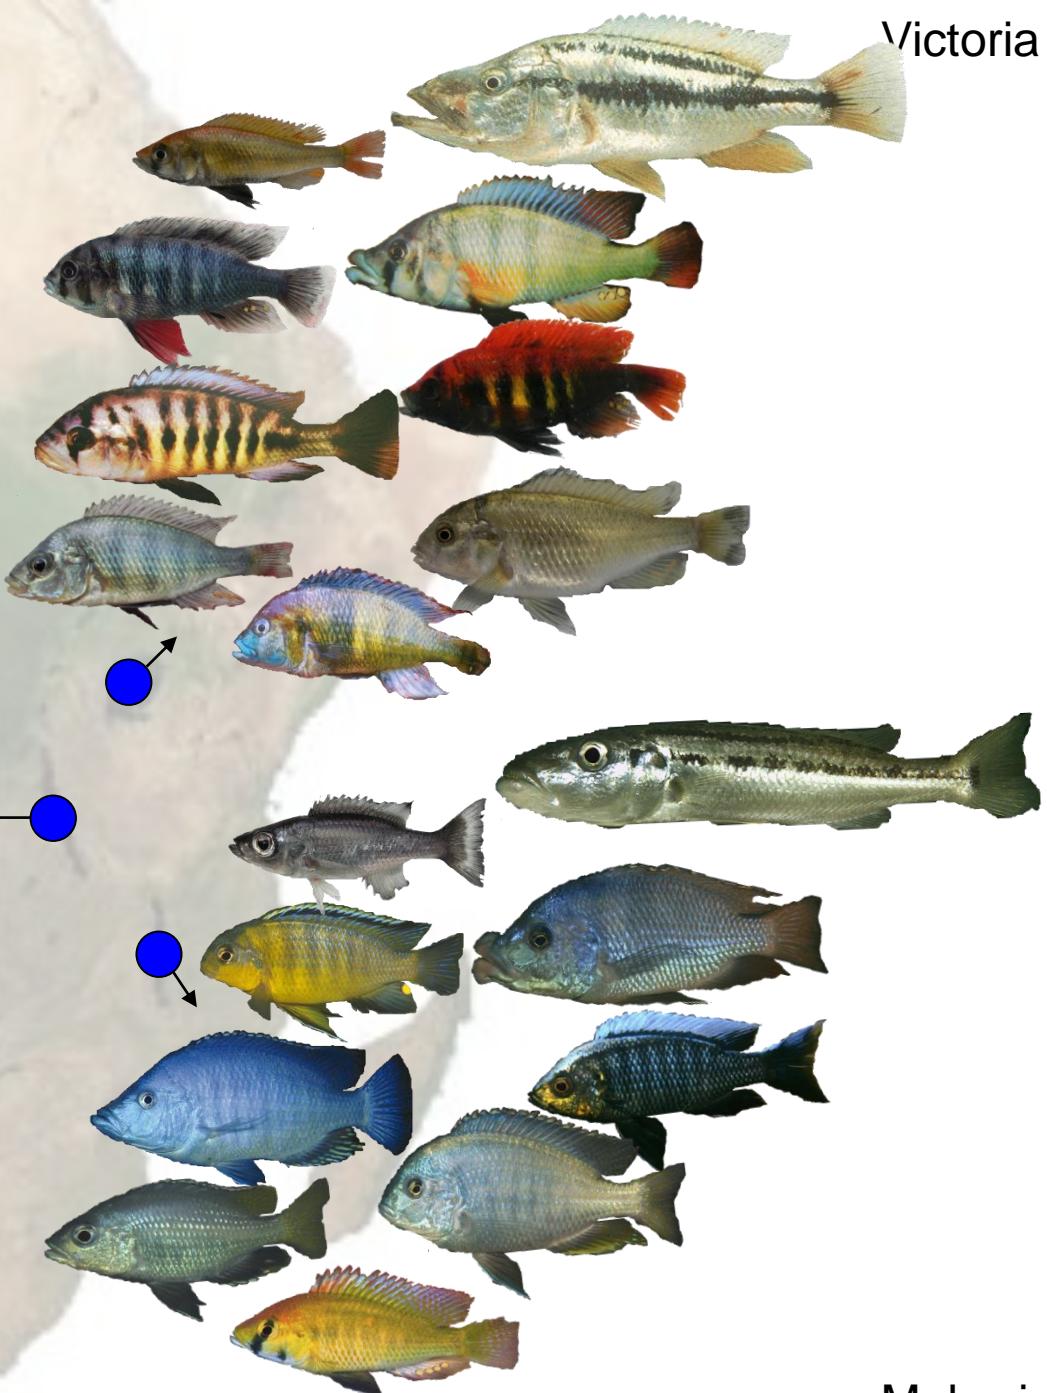

>90% of these belong to a  
single family:  
**cichlid fish**

Victoria

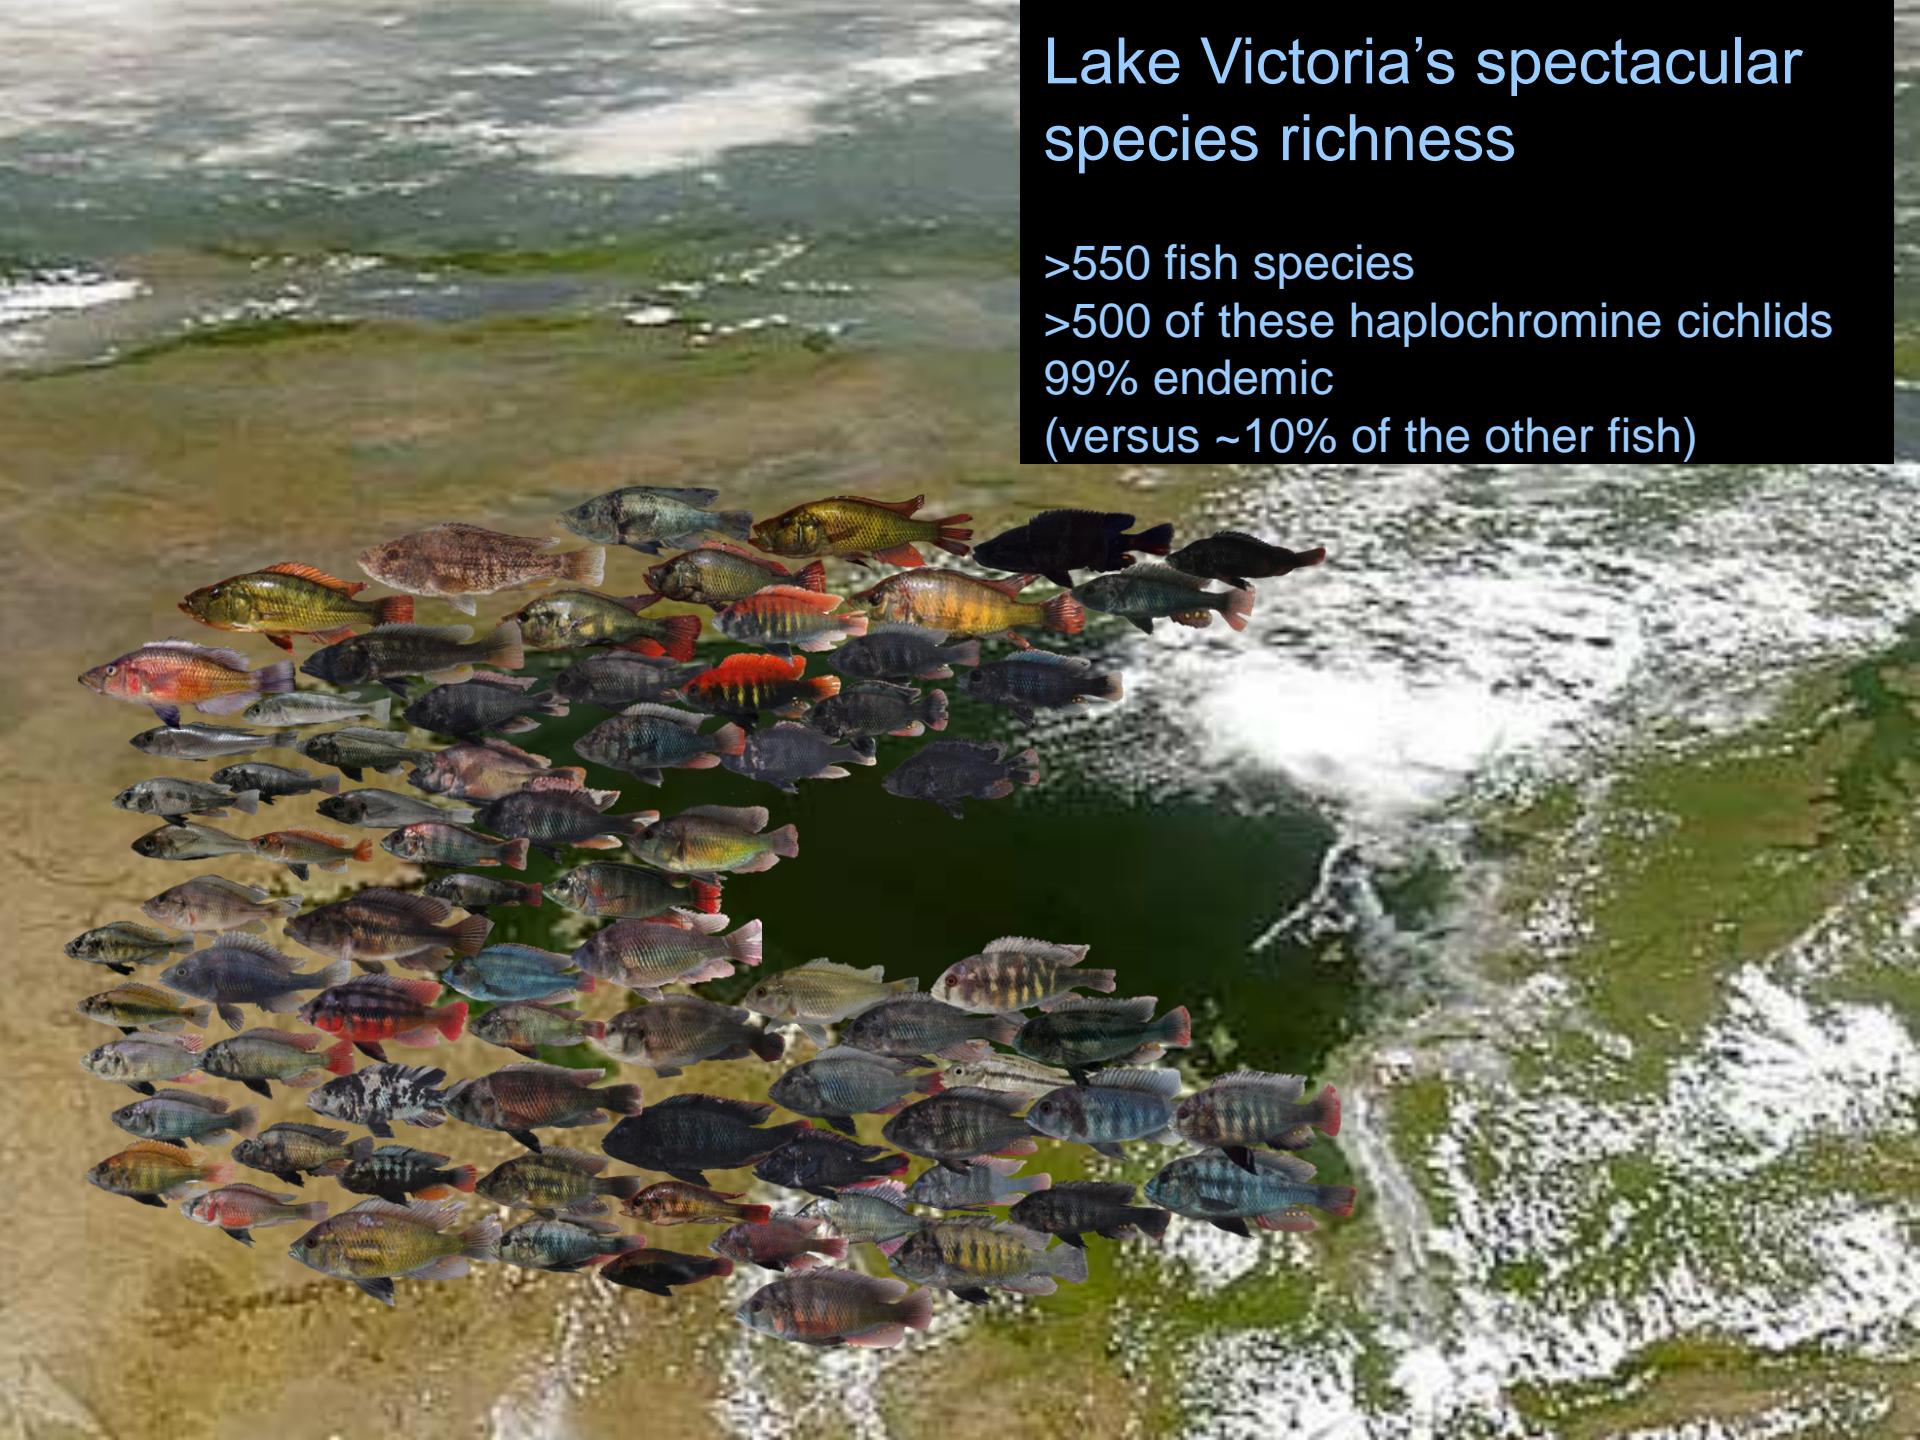

~1500 species in the 3  
largest African lakes alone

Malawi

Tanganyika

A large school of colorful cichlid fish, including various species of haplochromines, swims in the clear, shallow waters of Lake Victoria. The fish are densely packed, creating a vibrant cluster against the greenish-blue water.

# Lake Victoria's spectacular species richness

>550 fish species

>500 of these haplochromine cichlids

99% endemic

(versus ~10% of the other fish)

# REVIEW

doi:10.1038/nature11148

## Biodiversity loss and its impact on humanity

Hooper<sup>4</sup>, Charles Perrings<sup>5</sup>, Patrick Venail<sup>1</sup>, Anita Narwani<sup>1</sup>, Georgina M. Mace<sup>6</sup>, David Tilman<sup>7</sup>, David A. Wardle<sup>8</sup>, Ann P. Kinzig<sup>5</sup>, Gretchen C. Daily<sup>9</sup>, Michel Loreau<sup>10</sup>, James B. Grace<sup>11</sup>, Anne Larigauderie<sup>12</sup>, Diane S. Srivastava<sup>13</sup> & Shahid Naeem<sup>14</sup>

The most unique feature of Earth is the existence of life, and the most extraordinary feature of life is its diversity. Approximately 9 million types of plants, animals, protists and fungi inhabit the Earth. So, too, do 7 billion people. Two decades ago, at the first Earth Summit, the vast majority of the world's nations declared that human actions were dismantling the Earth's ecosystems, eliminating genes, species and biological traits at an alarming rate. This observation led to the question of how such loss of biological diversity will alter the functioning of ecosystems and their ability to provide society with the goods and services needed to prosper.

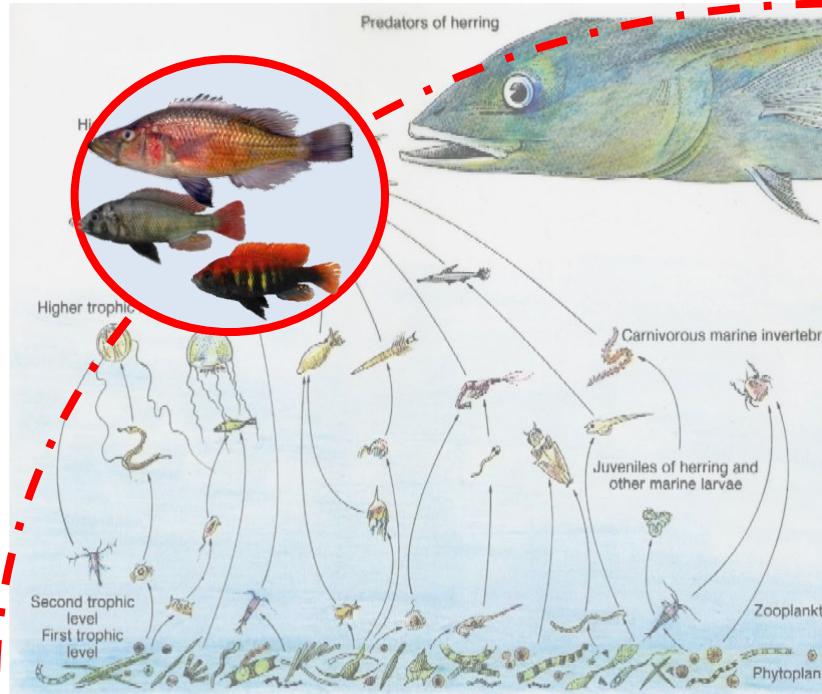

# The empirical relationship of biodiversity and ecosystem function

Biodiversity does affect ecosystem  
functions and an ecosystem's  
multifunctionality

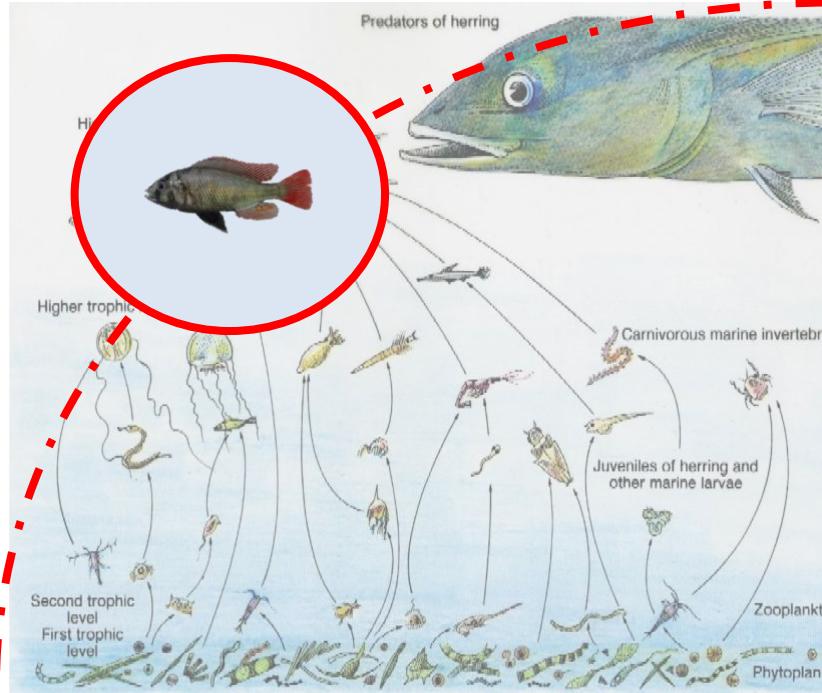

does it affect ecosystem services?

Ecosystem Function (Resource capture, biomass production etc.)

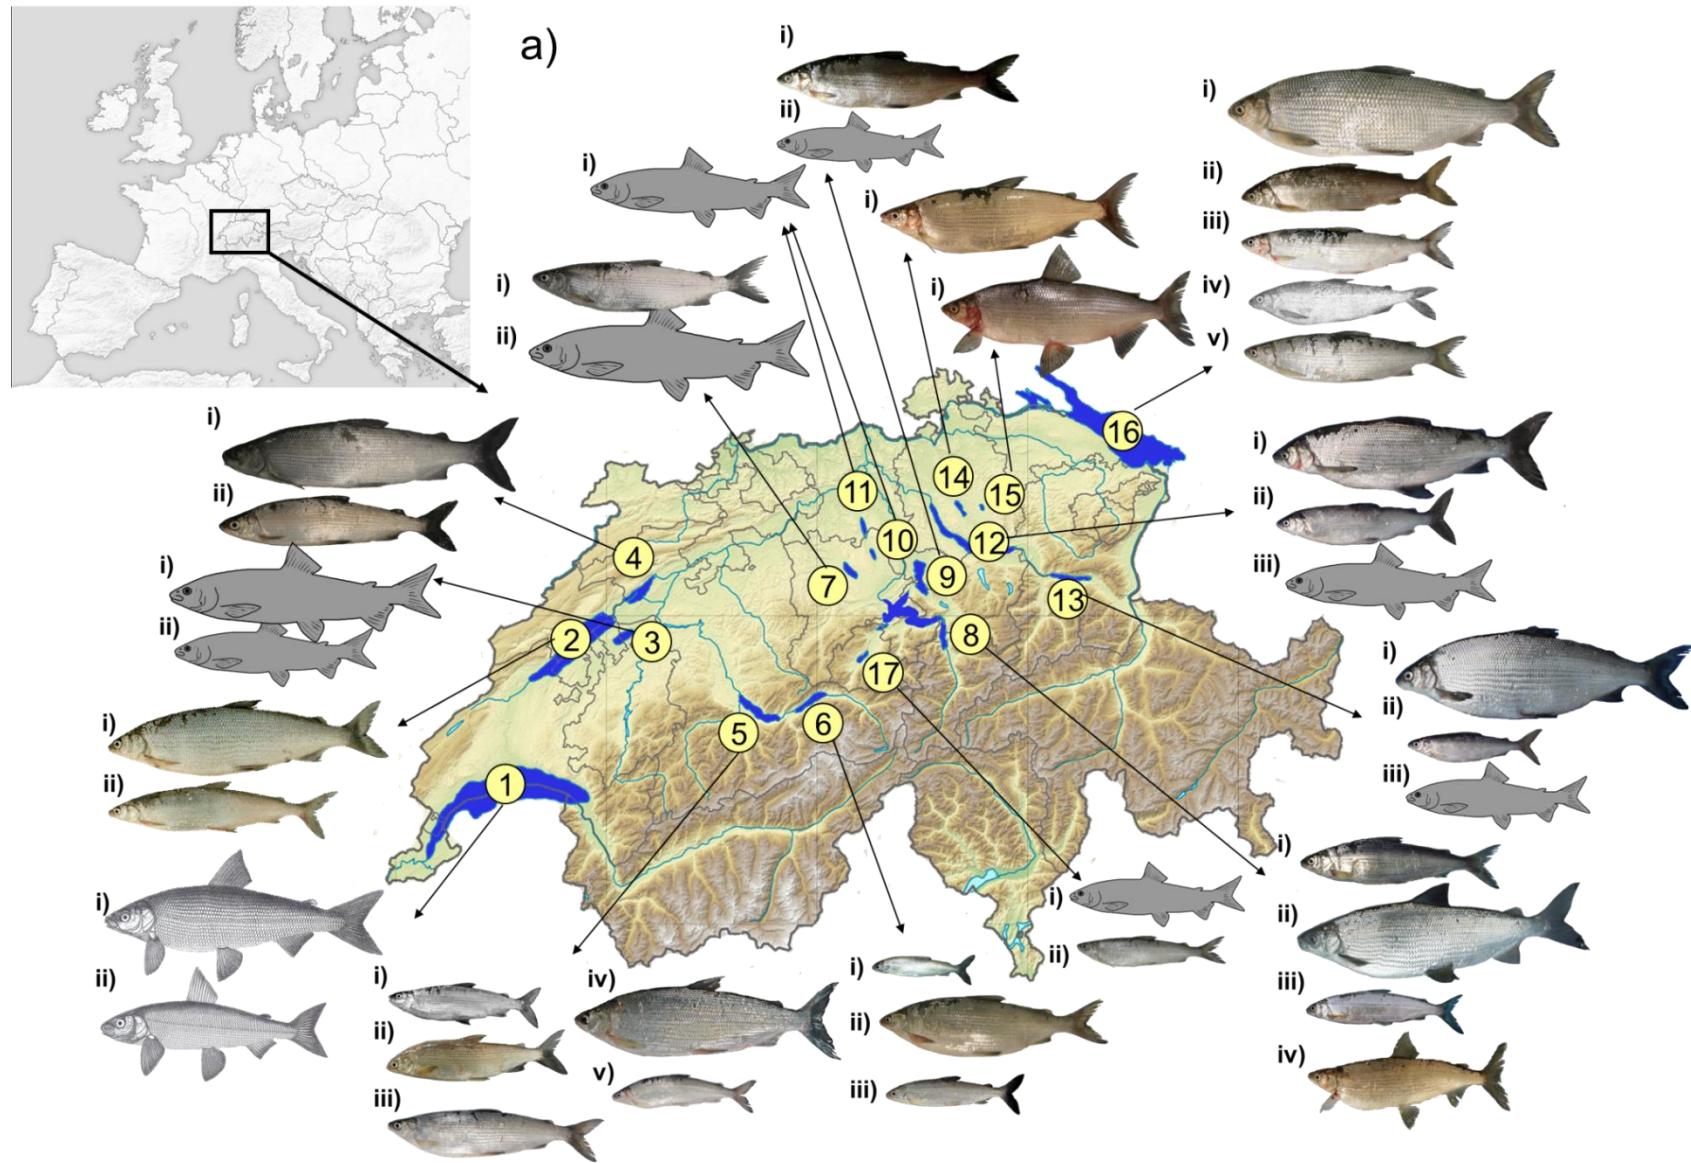

Biological Diversity  
(genes, species, functional traits)

Ecosystem Function (Resource capture, biomass production etc.)

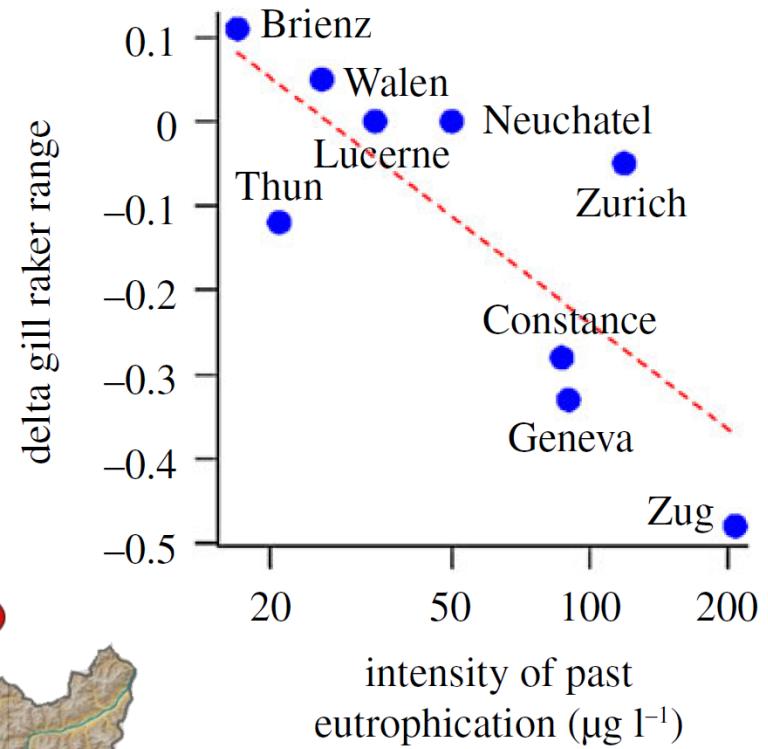

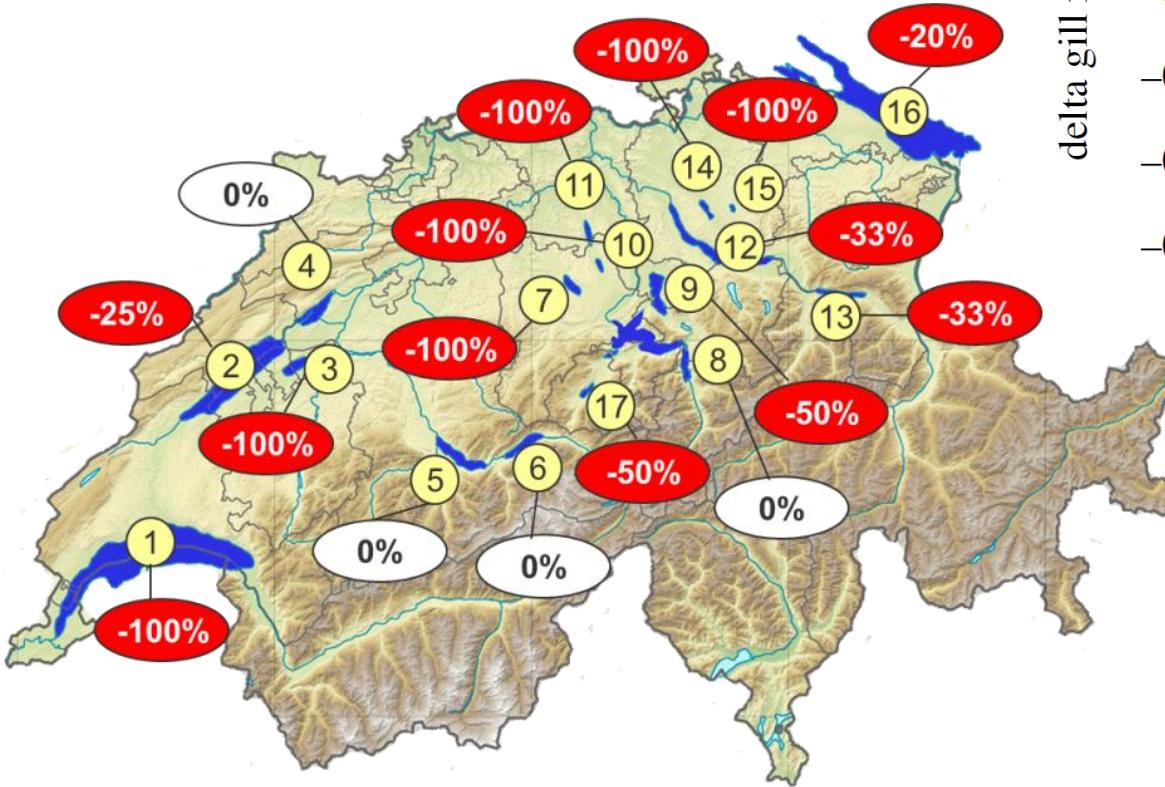

Biological Diversity  
(genes, species, functional traits)

# endemic whitefish in Swiss lakes: another global biodiversity heritage

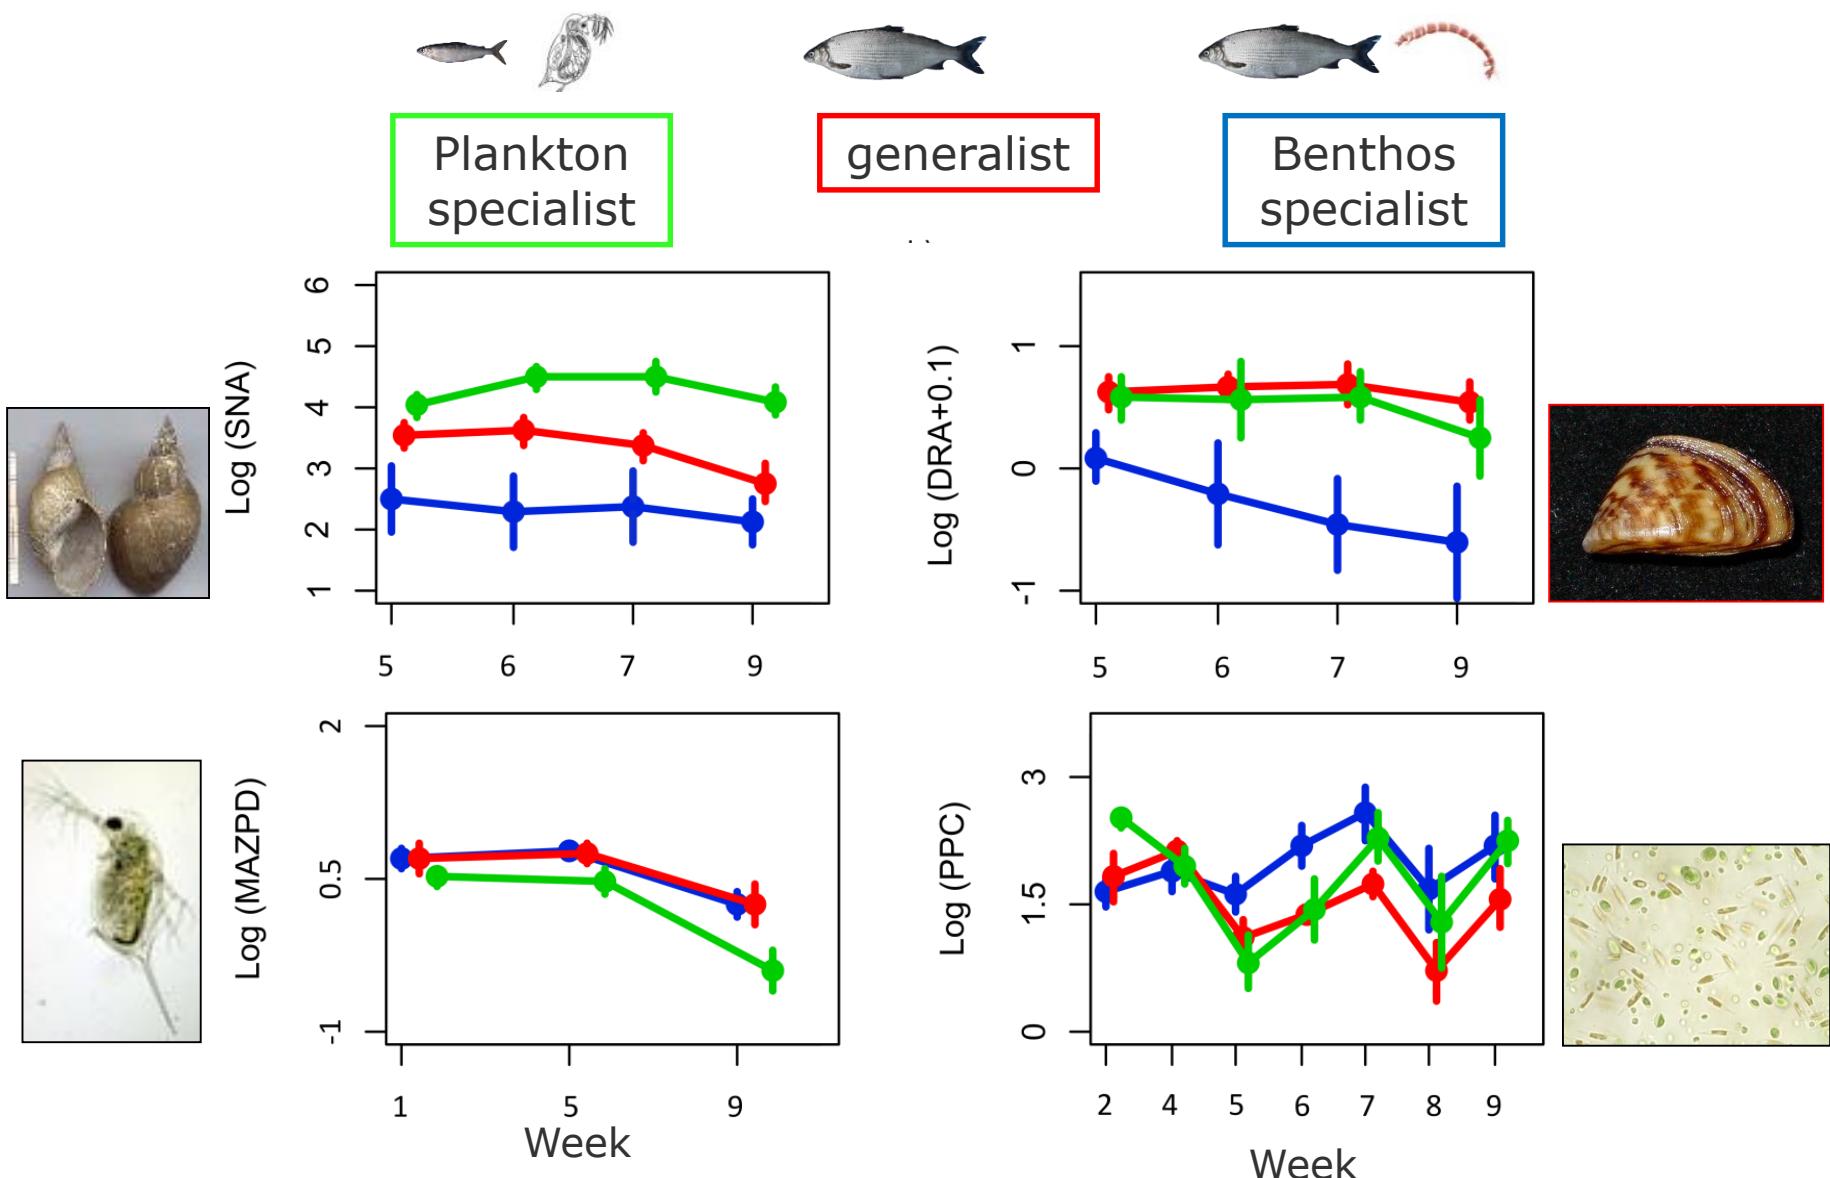

# Eutrophication led to the collapse of species and loss of functional diversity

Two to six distinct species were replaced by one or a few generalist populations in many lakes

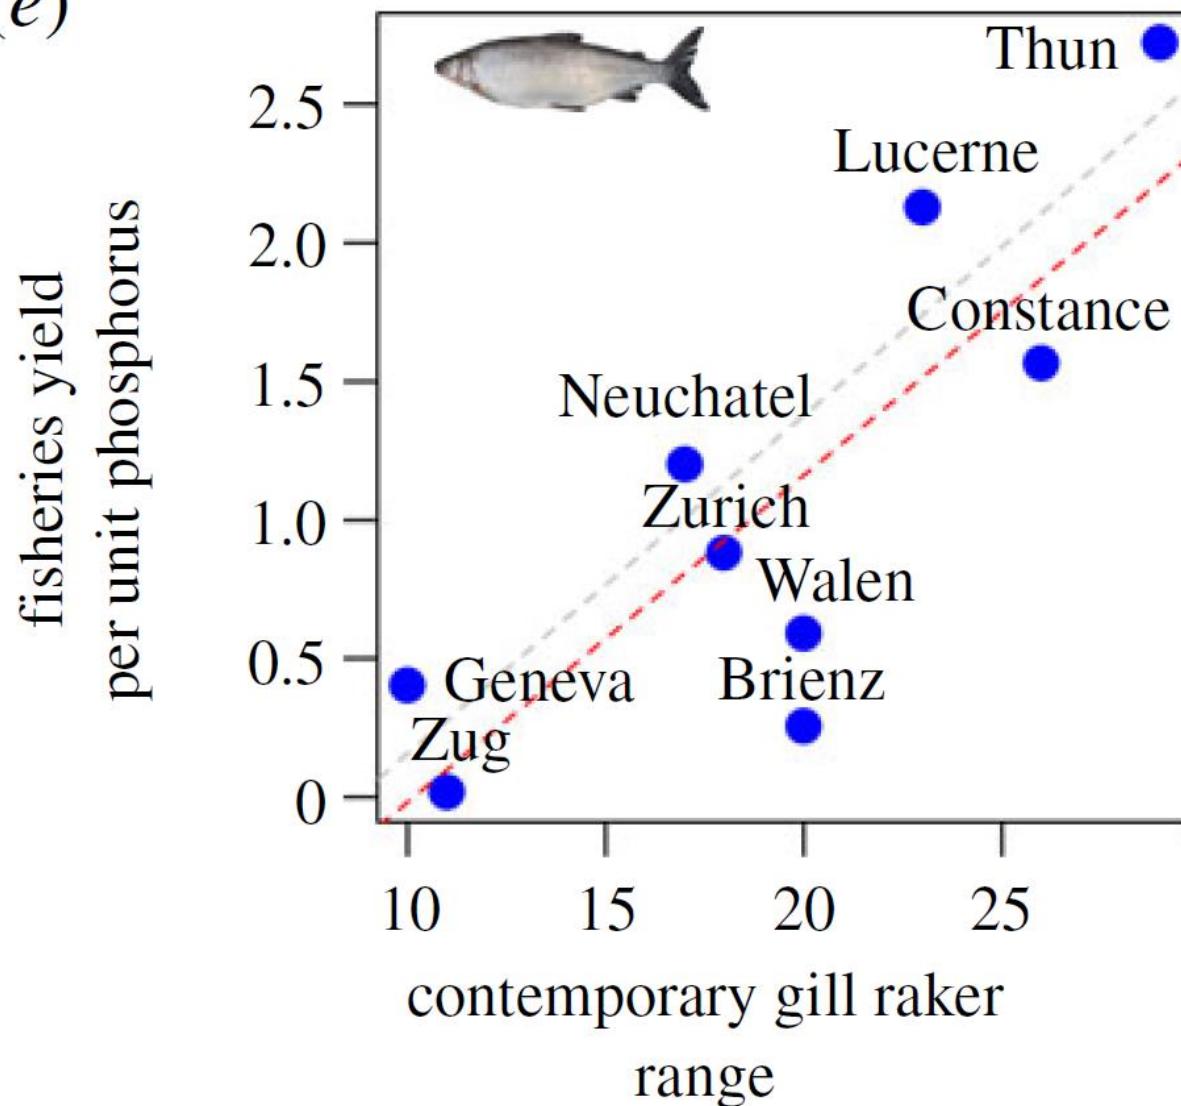

# Different whitefish species extract different resources from a lake

# Extant functional diversity in whitefish predicts commercial catch

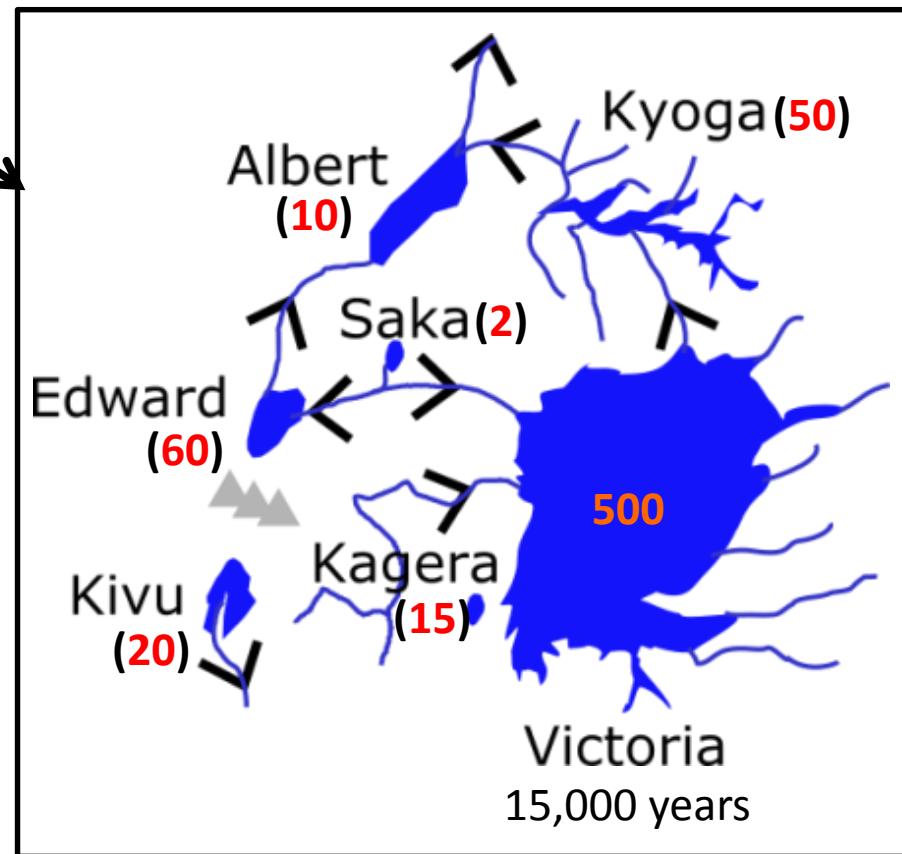

(e)

Colin Newman 1995

# Endemic cichlids dominate assemblages in most lakes of the Lake Victoria Region: total >700 endemic cichlid species

Species diversity has been rapidly declining, about 200 endemic species have already gone extinct in Lake Victoria between 1980s and now

Colin Newman 1995

Identifying and documenting the species diversity and genetic structure of these cichlids was impossible...

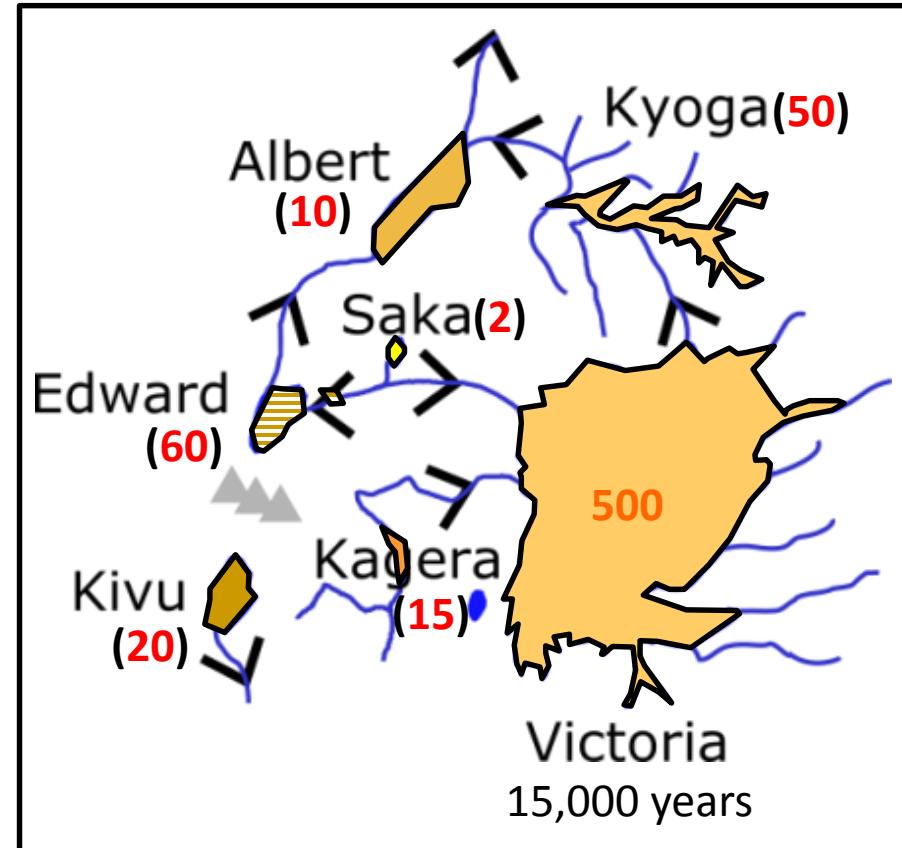

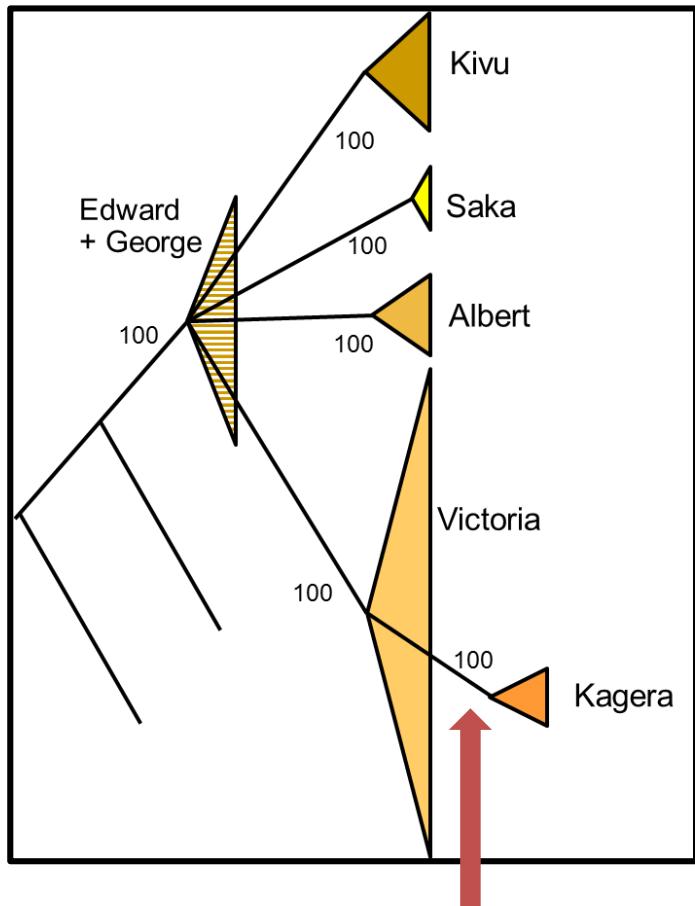

now it is possible for the very first time

.....

it takes Next Generation DNA Sequencing

# 1. The relationships **among the lakes** in the region

## Lake Victoria Region Superflock (700 cichlid species)

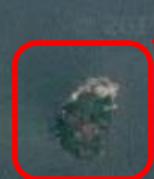

**Every lake in the region has its own endemic fauna**

From the lake-wide pattern to the species  
at the very local scale

Makobe Island

Makobe Island

Igombe

Bus

## 2. The local scale **among** the species in a single assemblage:

Makobe Island (Speke Gulf, Tanzania)

*Neo. omnicaeruleus*

*Neo. rufocaudalis*

*Neo. sp. «unicuspid scraper»*

*Neo. gigas*

*Pundamilia nyererei*

*Pundamilia pundamilia*

*Pundamilia sp. «pink anal»*

*Lipochromis melanopterus*

*Mbipia lutea*

*Mbipia mbipia*

*Labro. sp. «stone»*

*Harpargo. cf. serranus*

*Paralabido. sp. «rockkribensis»*

*Paralabido. sp. «short snout scraper»*

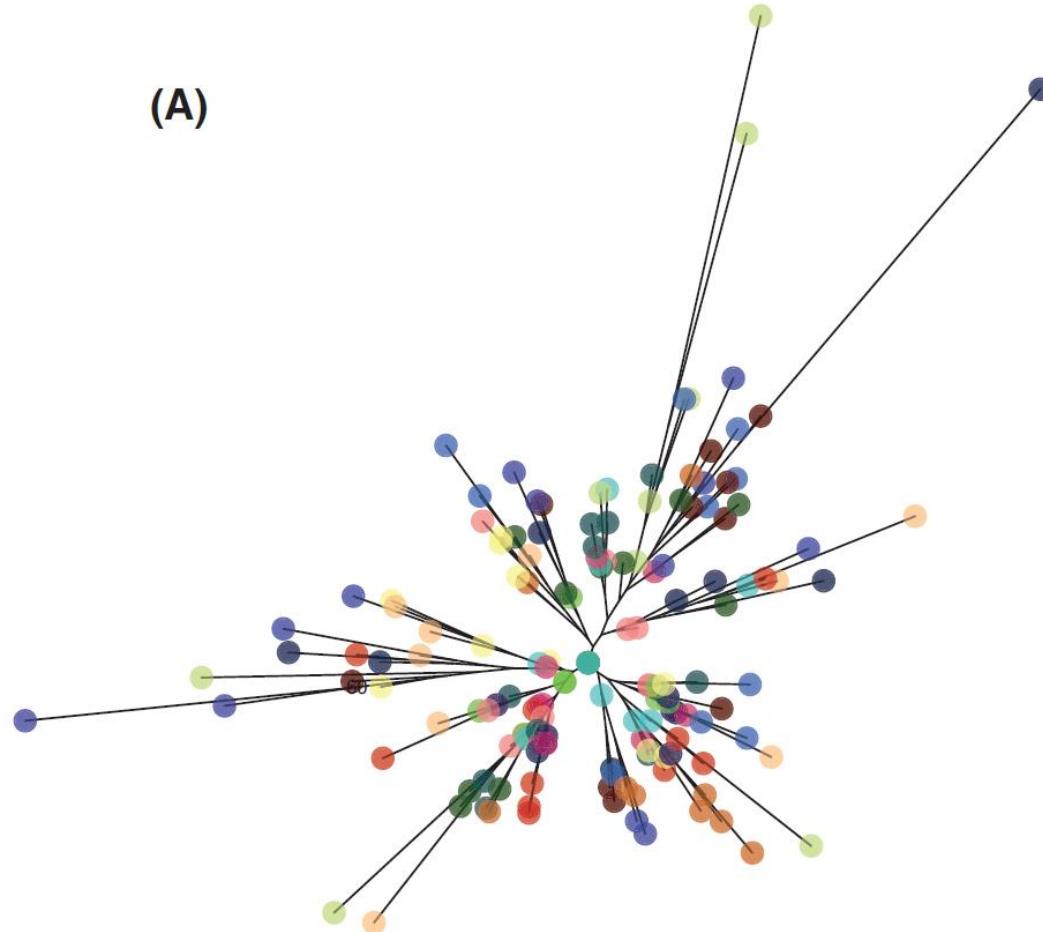

*Paralabido. cyaneus*

*Paralabido. chilotes*

# Genome-wide relationships among species: 3'500 bp

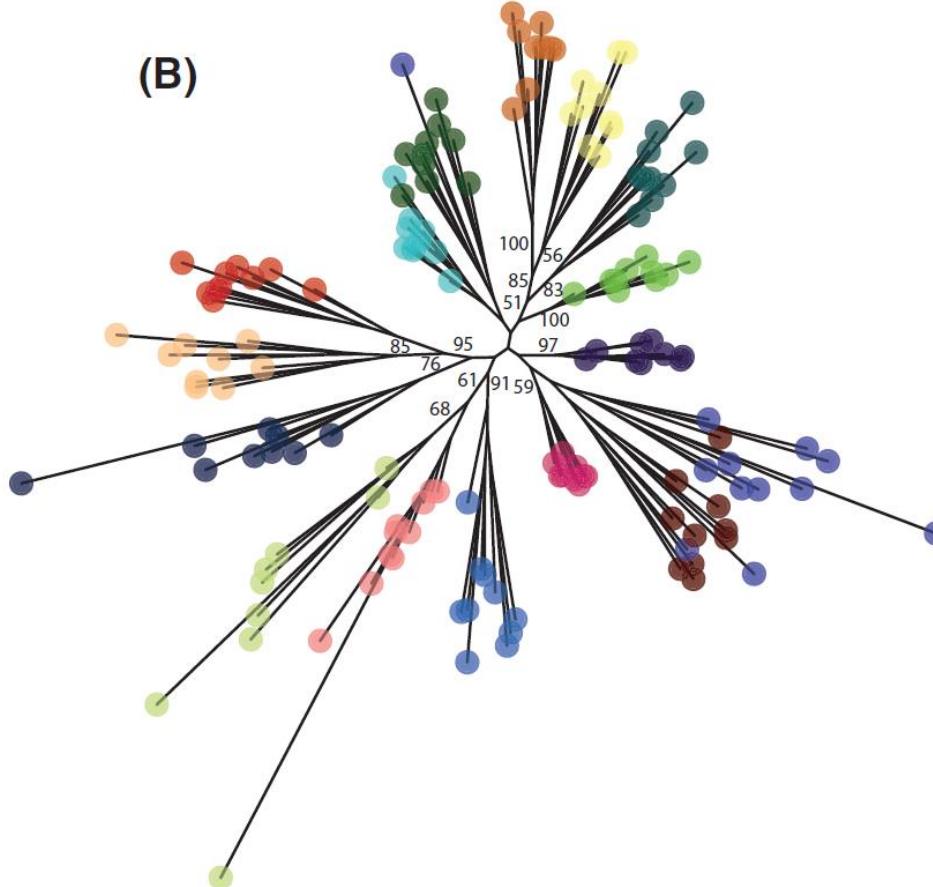

(A)

A mess, are species not real?

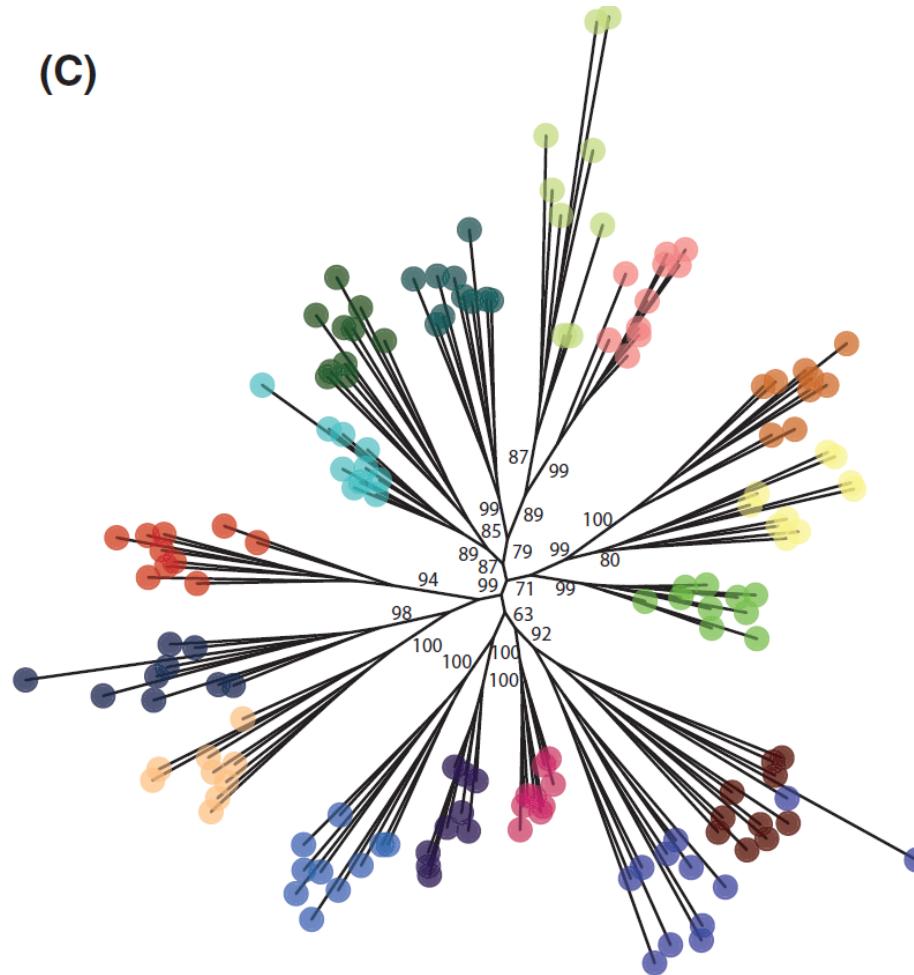

# Genome-wide relationships **among species**: 30'000 bp

(B)

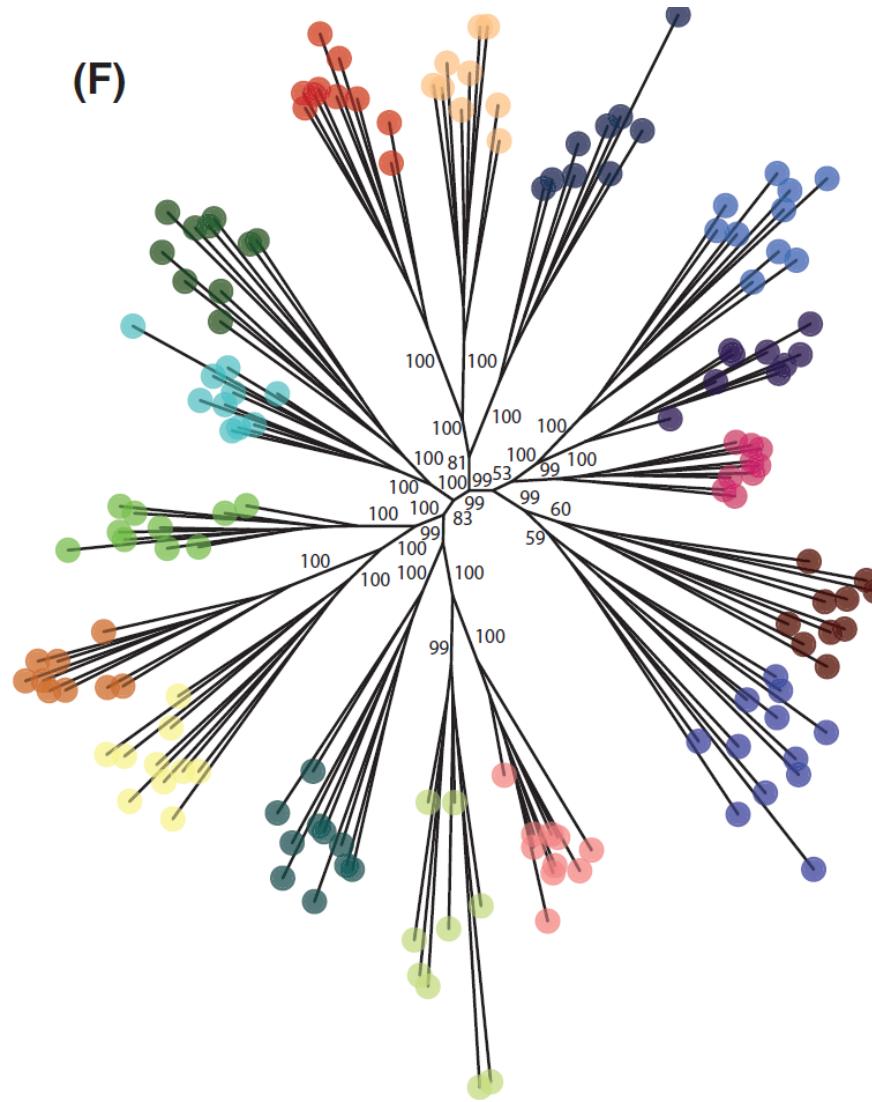

# Genome-wide relationships among species: 300'000 bp

(C)

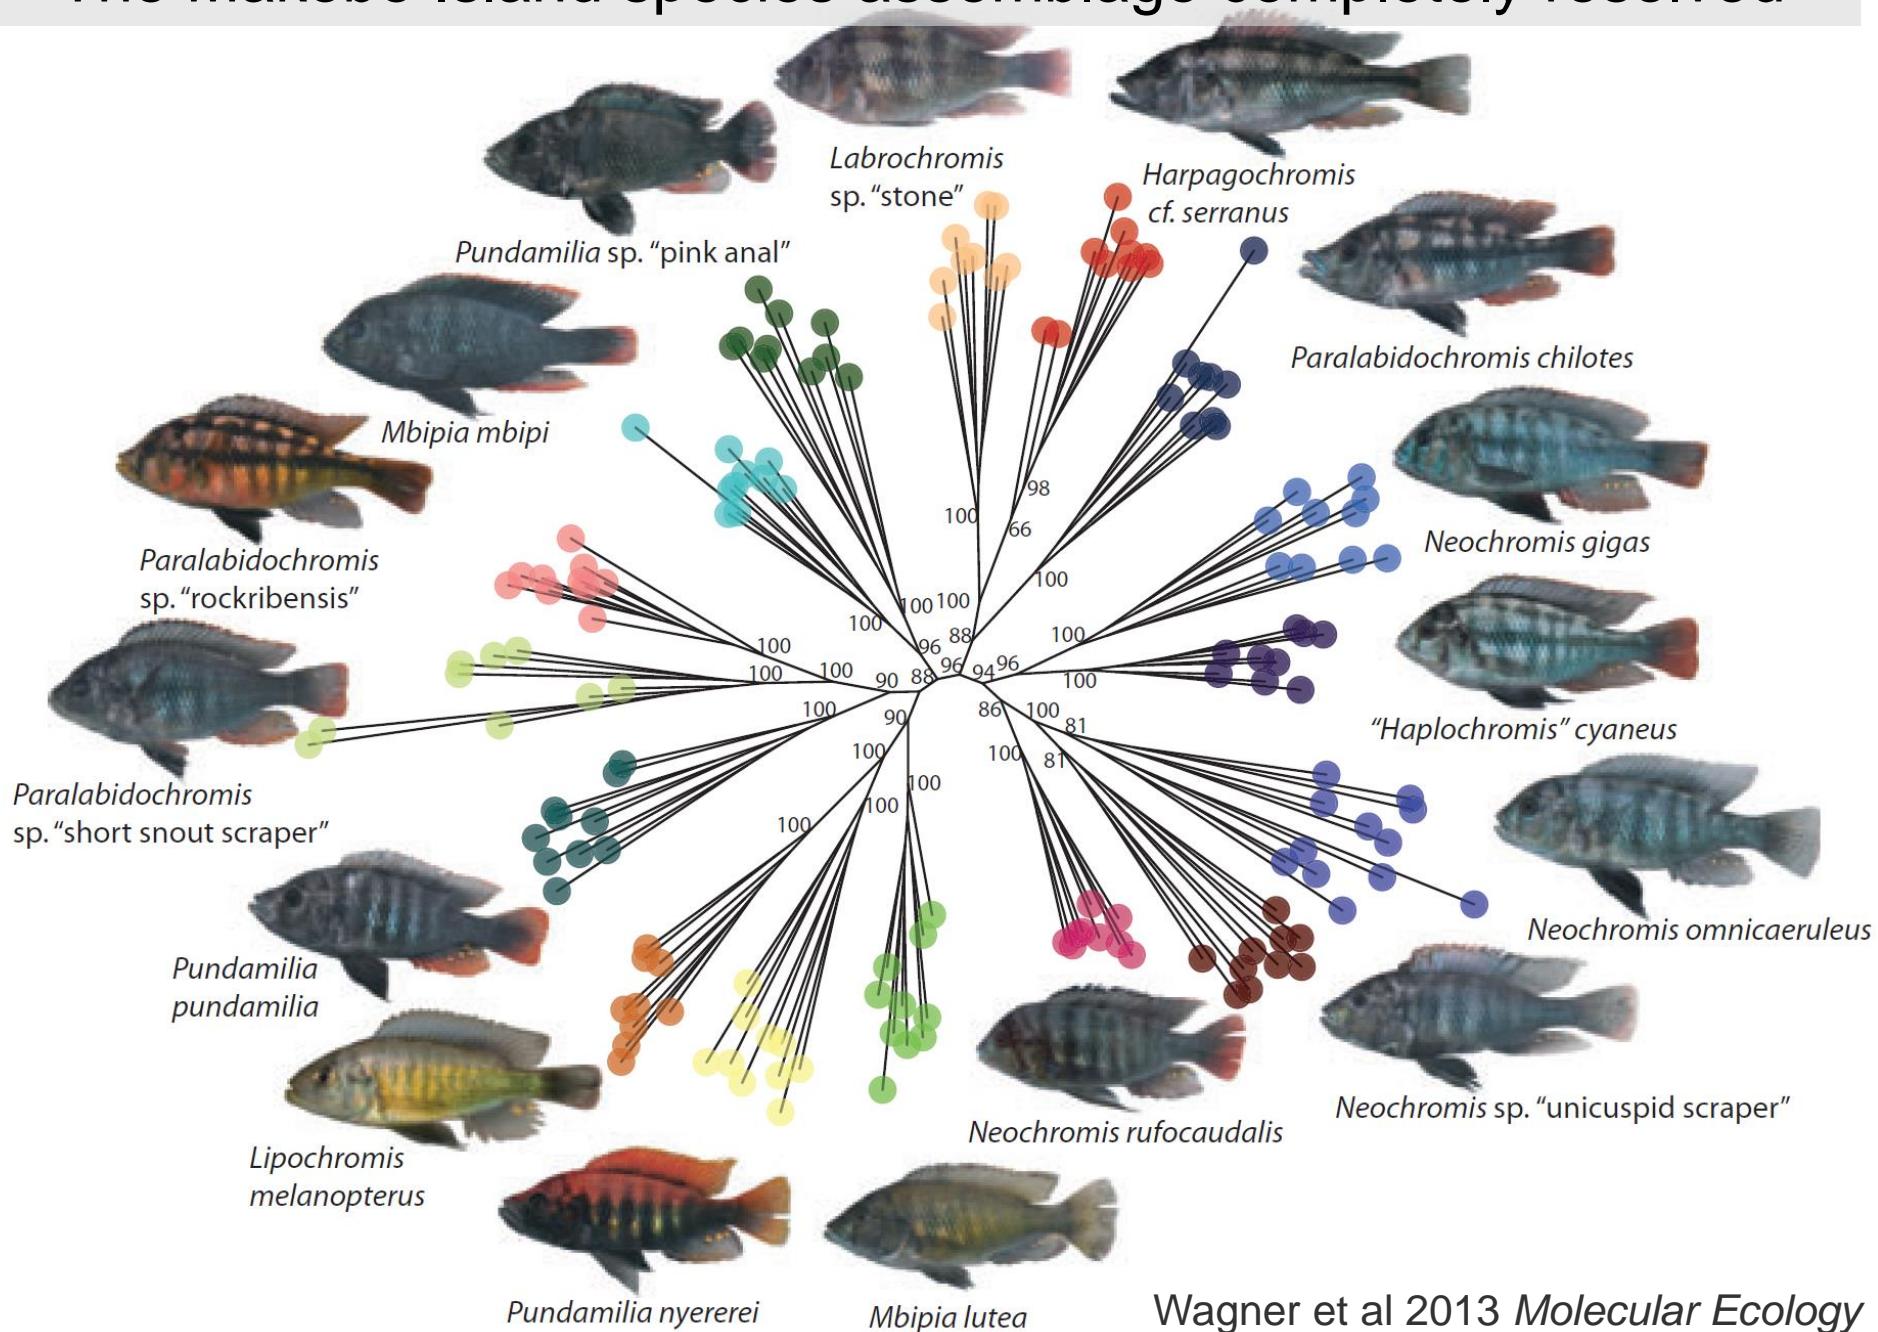

# Genome-wide relationships among species: 3'000'000 bp

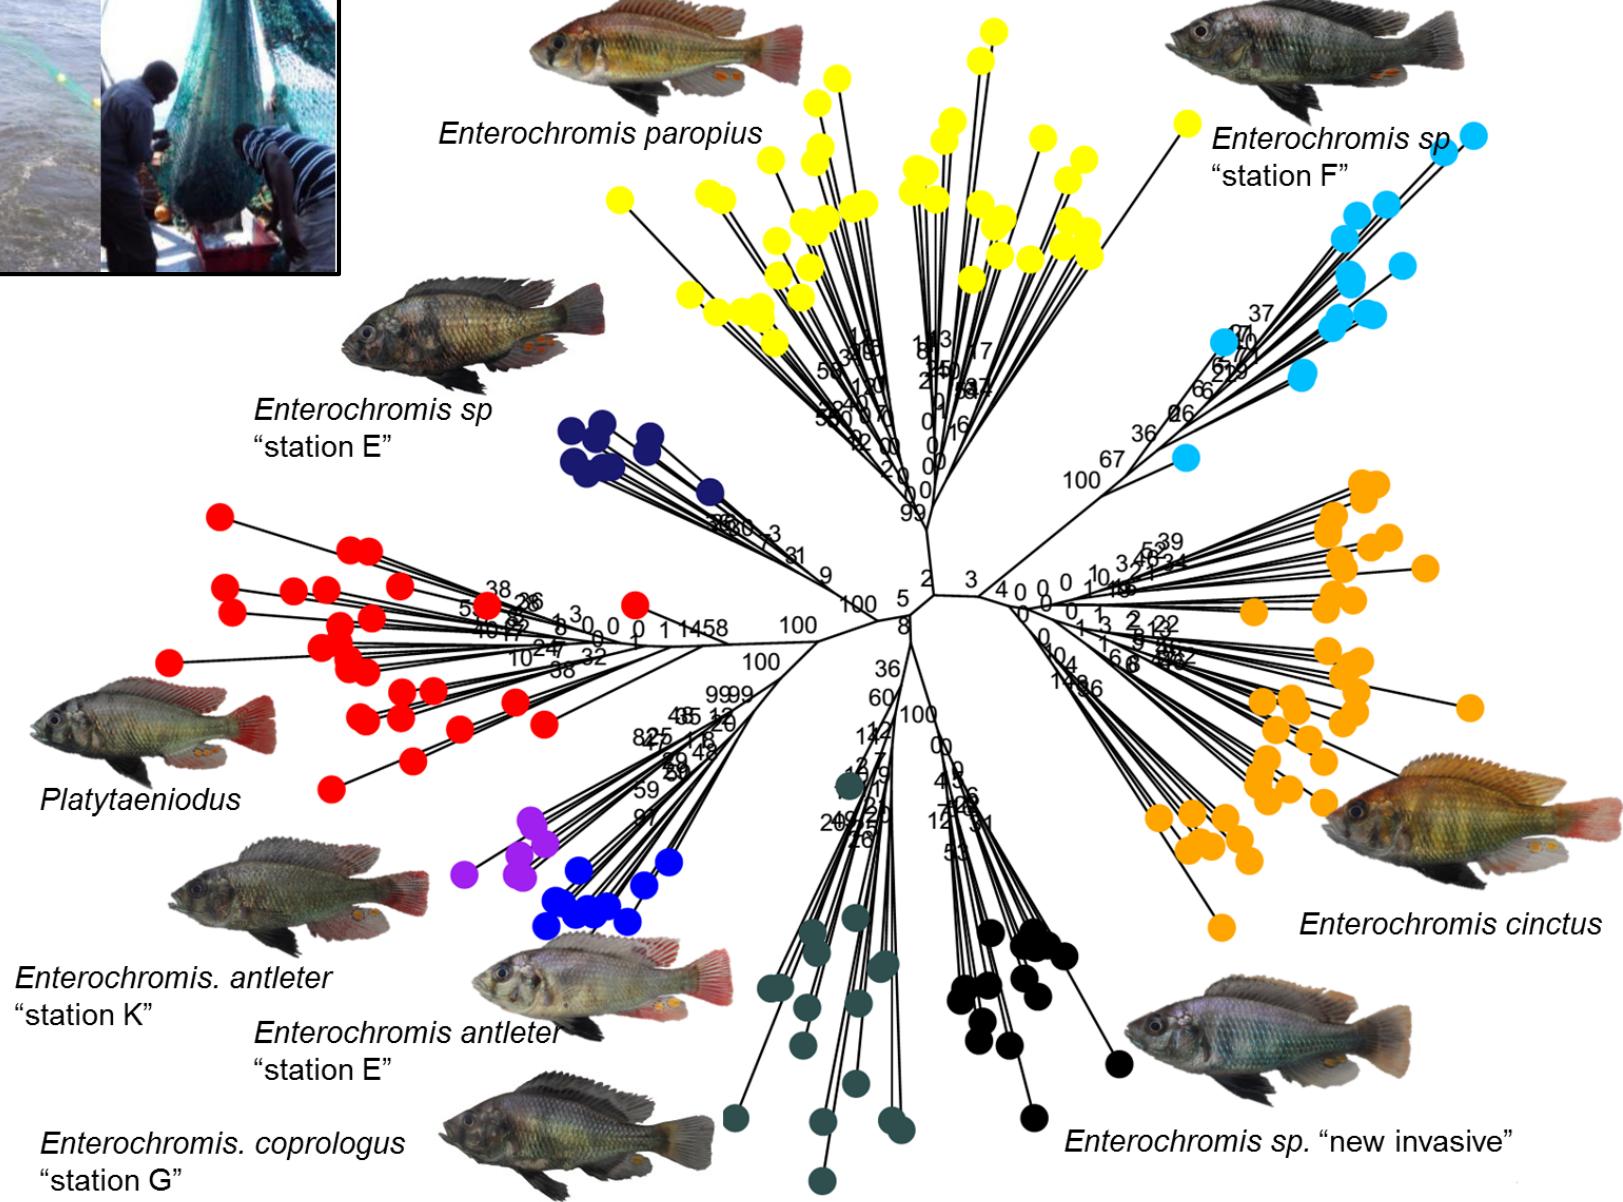

Species are VERY real

# The Makobe Island species assemblage completely resolved

# An offshore demersal assemblage completely resolved too

Where did all the genetic variation come  
from in merely 15'000 years of Lake Victoria  
history?

# The entire flock of cichlid radiations in the Lake Victoria region has evolved from an ancient hybrid swarm

## Five-population test

(modified from  
Eaton & Ree, 2013)

## F4-ratio test

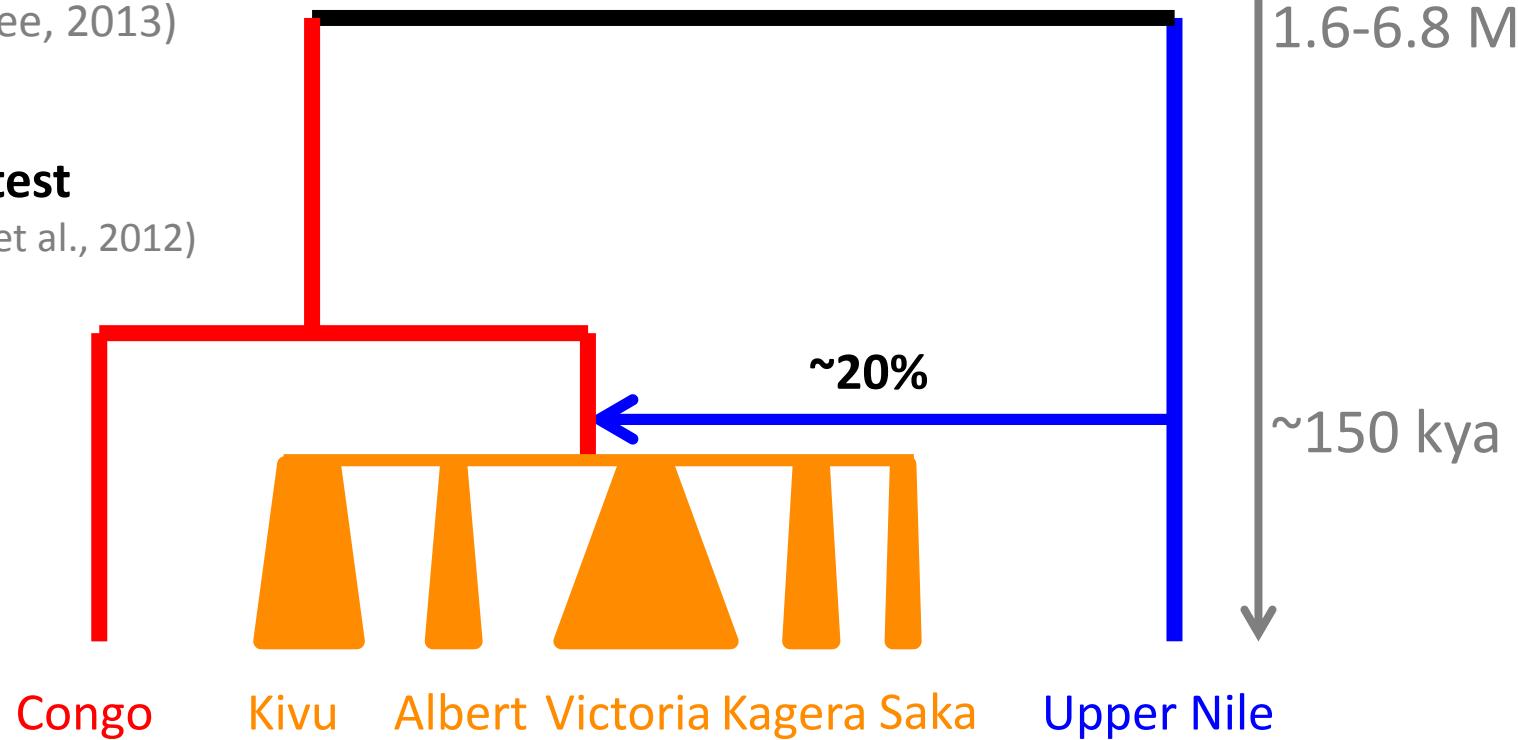

(Patterson et al., 2012)

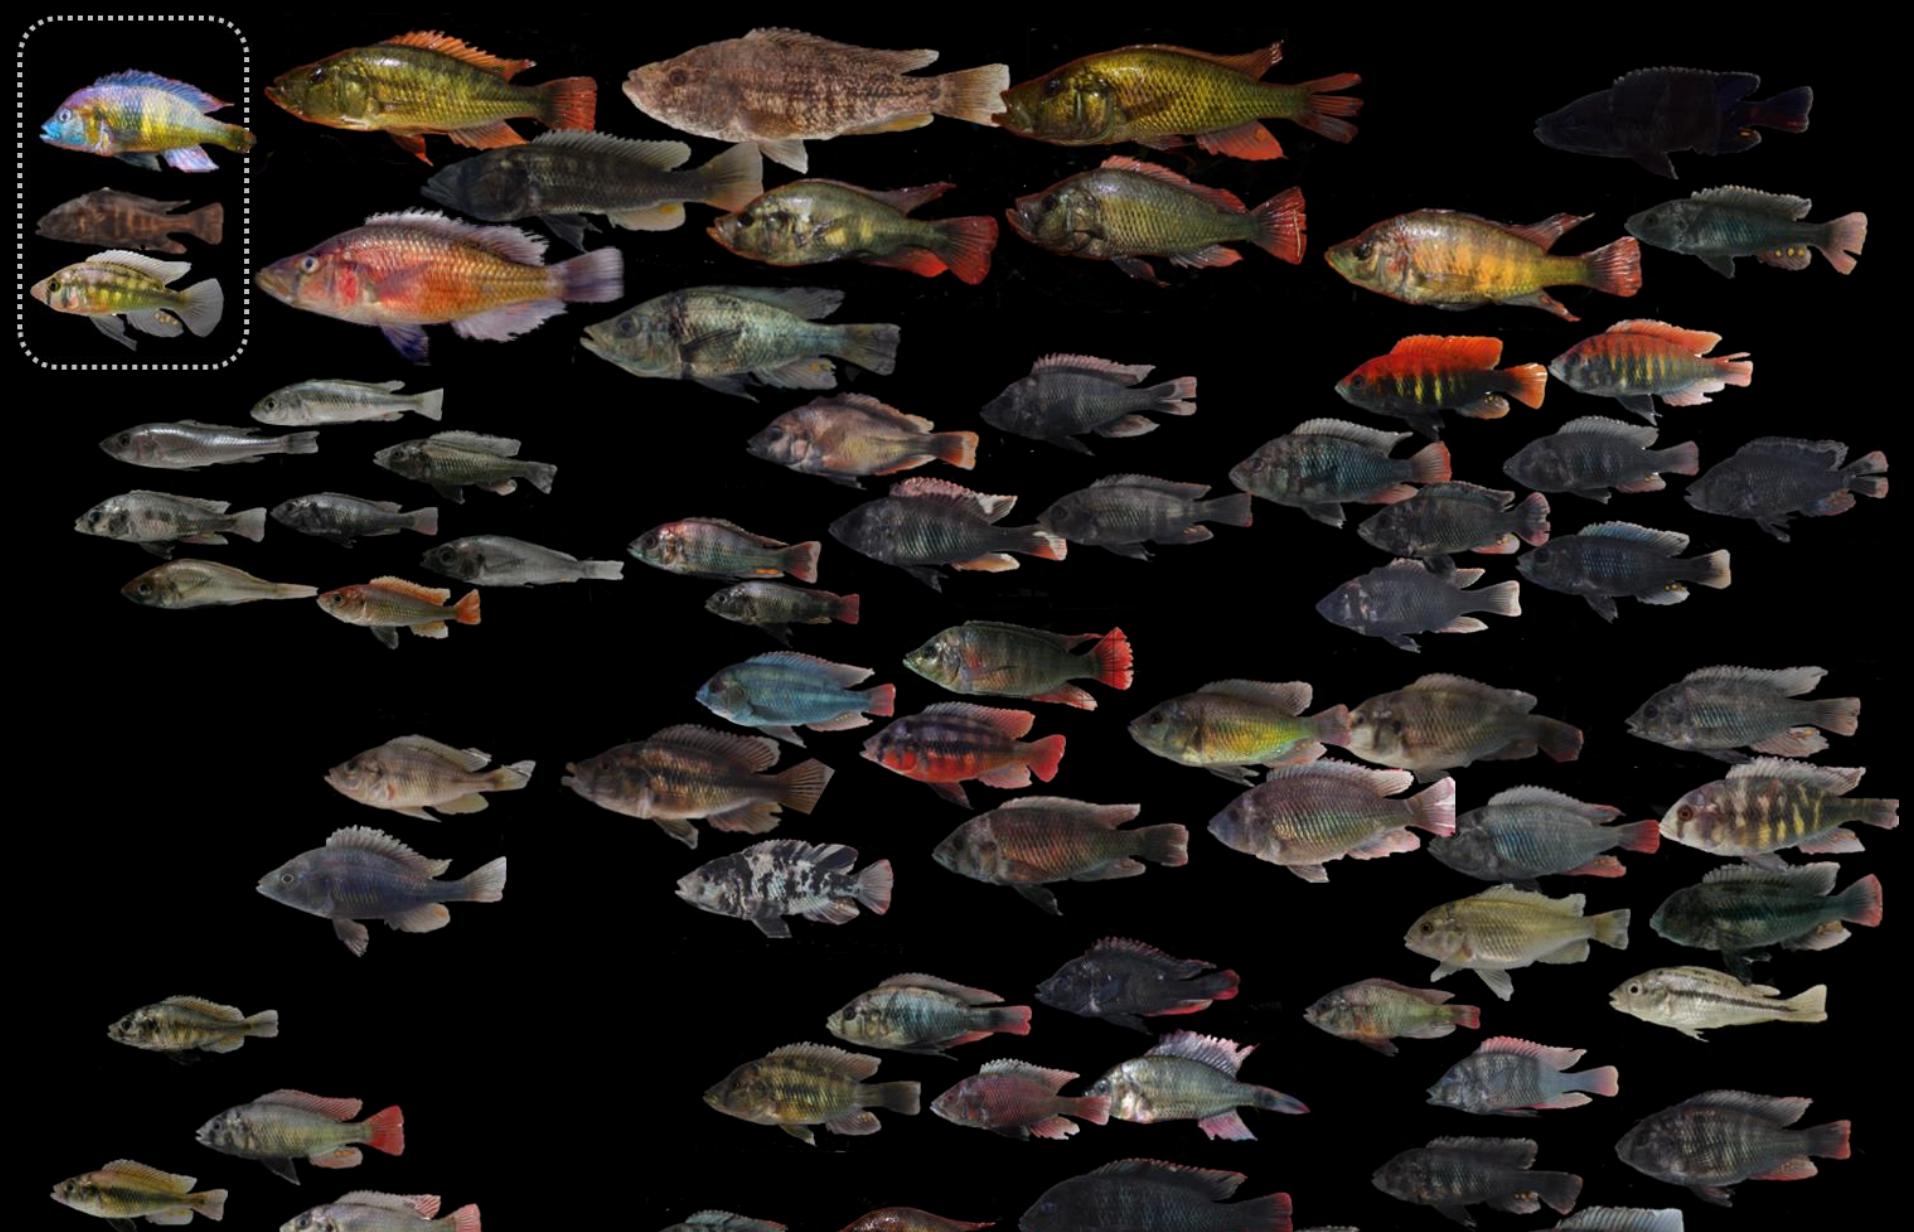

**BEAST**

(Bouckaert et al., 2014)

1.6-6.8 Ma

~150 kya

Hundreds of unique endemic species are made of ancient genetic variation

# The Structure of Biodiversity in the Lake Victoria Region

## What have we learned so far ?

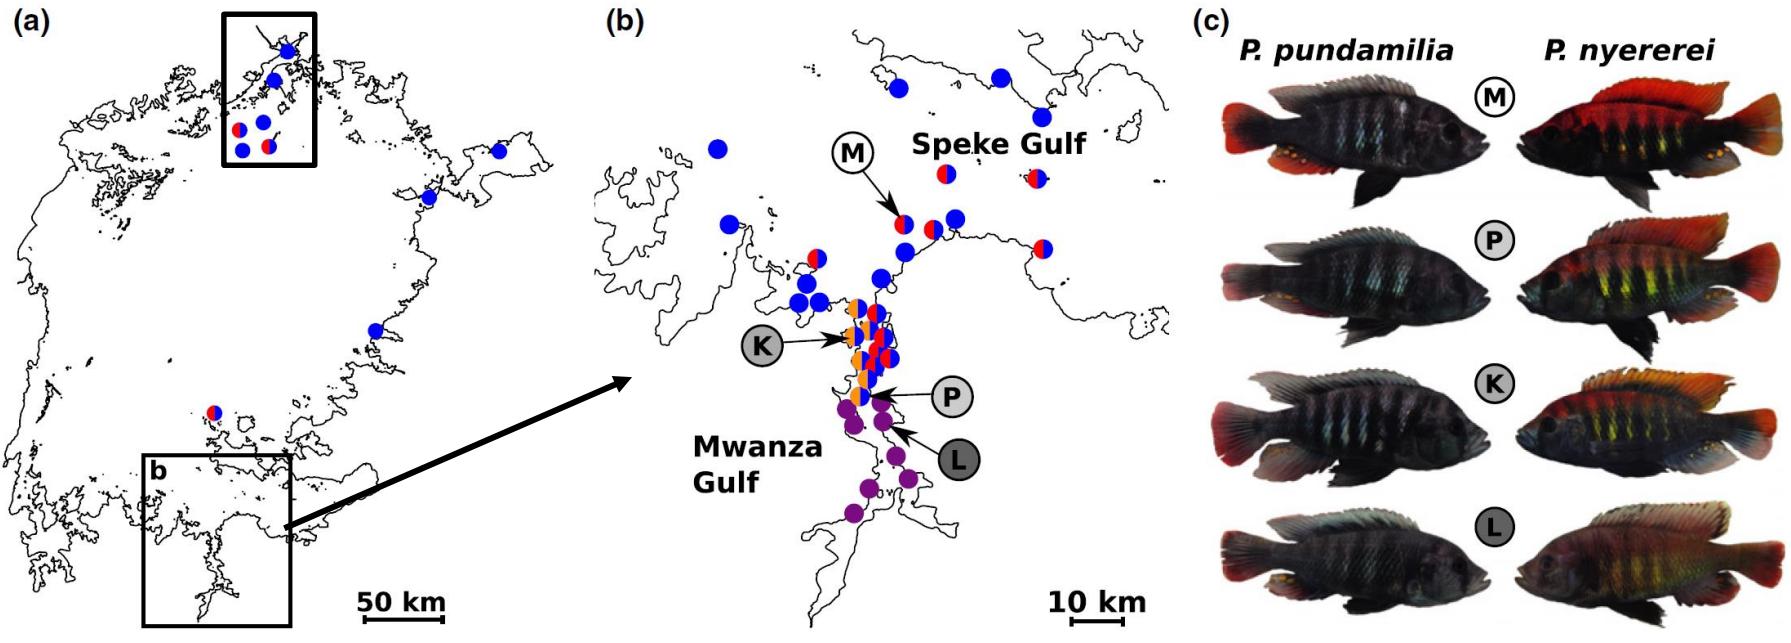

- Each lake in the region has unique endemic species assemblages
- >500 species are real - can be objectively verified with genomic data
- The Lake Victoria region cichlids contain much more genetic diversity and differentiation than previously thought:  
**the species are young but their genes are old**
- each habitat in Victoria - unique set of species with little sharing between habitats
- within macrohabitats, distributions are microhabitat-specific

# The Structure of Biodiversity in the Lake Victoria Region

## What do we still not know ?

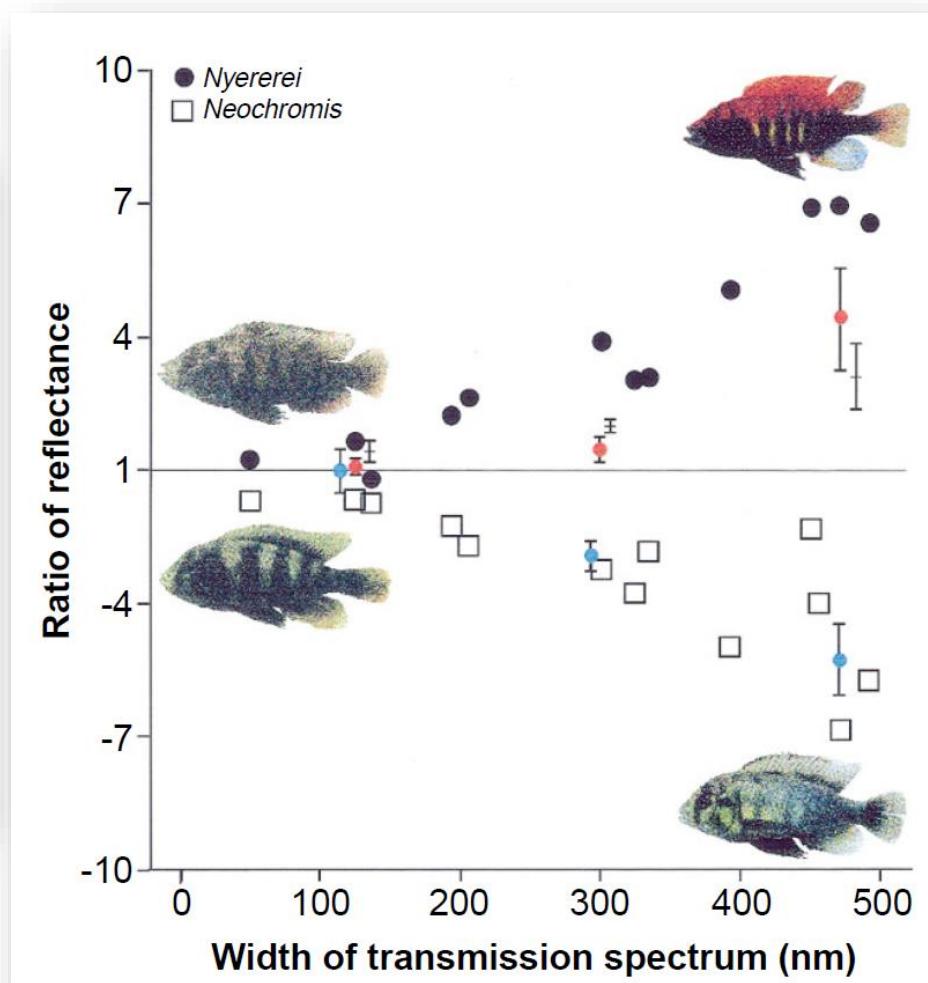

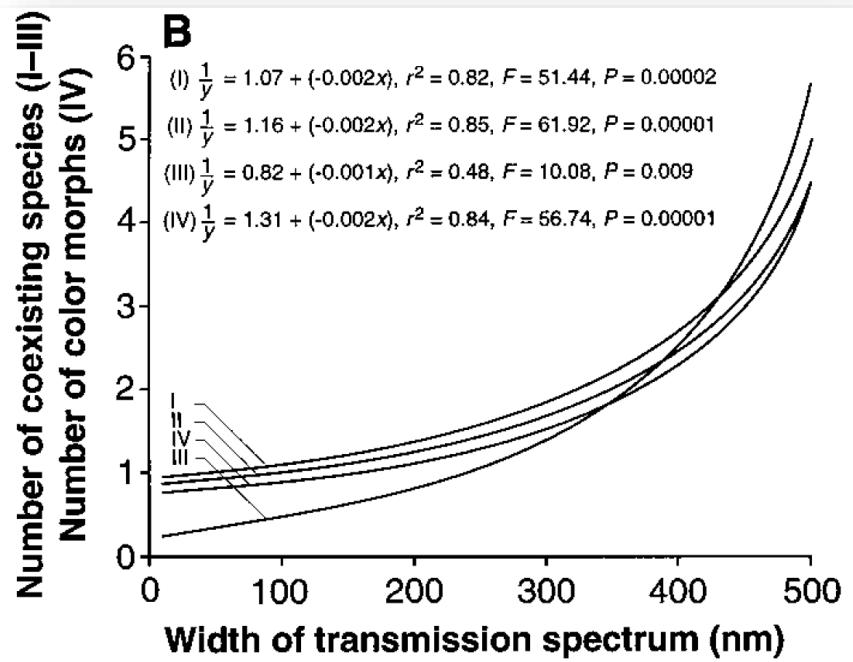

- the geographical distribution of species WITHIN Lake Vic

# Spatial mapping of diversity – current knowledge is patchy

but generates some strong predictions

# strong predictions: 1. water turbidity leads to biodiversity loss

## strong predictions 2: many more species await to be discovered

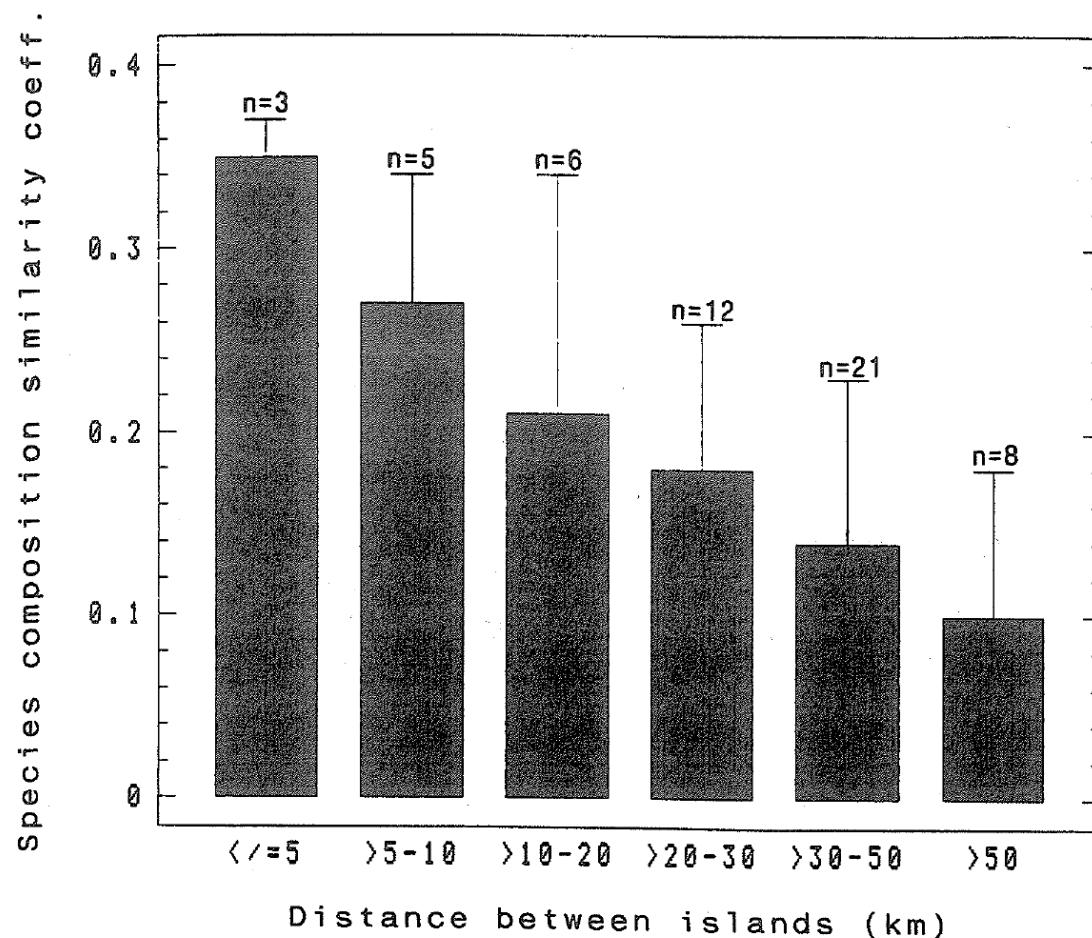

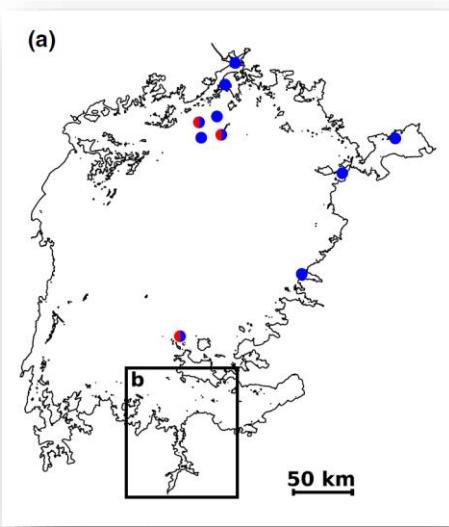

Figure 3 The relationship between the similarity in species composition between communities at patches of rocky habitat and the geographical distance between them. Species composition similarity coefficients are calculated as number of joint species divided by total number of species at two rocky islands

# The Structure of Biodiversity in the Lake Victoria Region

## What do we still not know ?

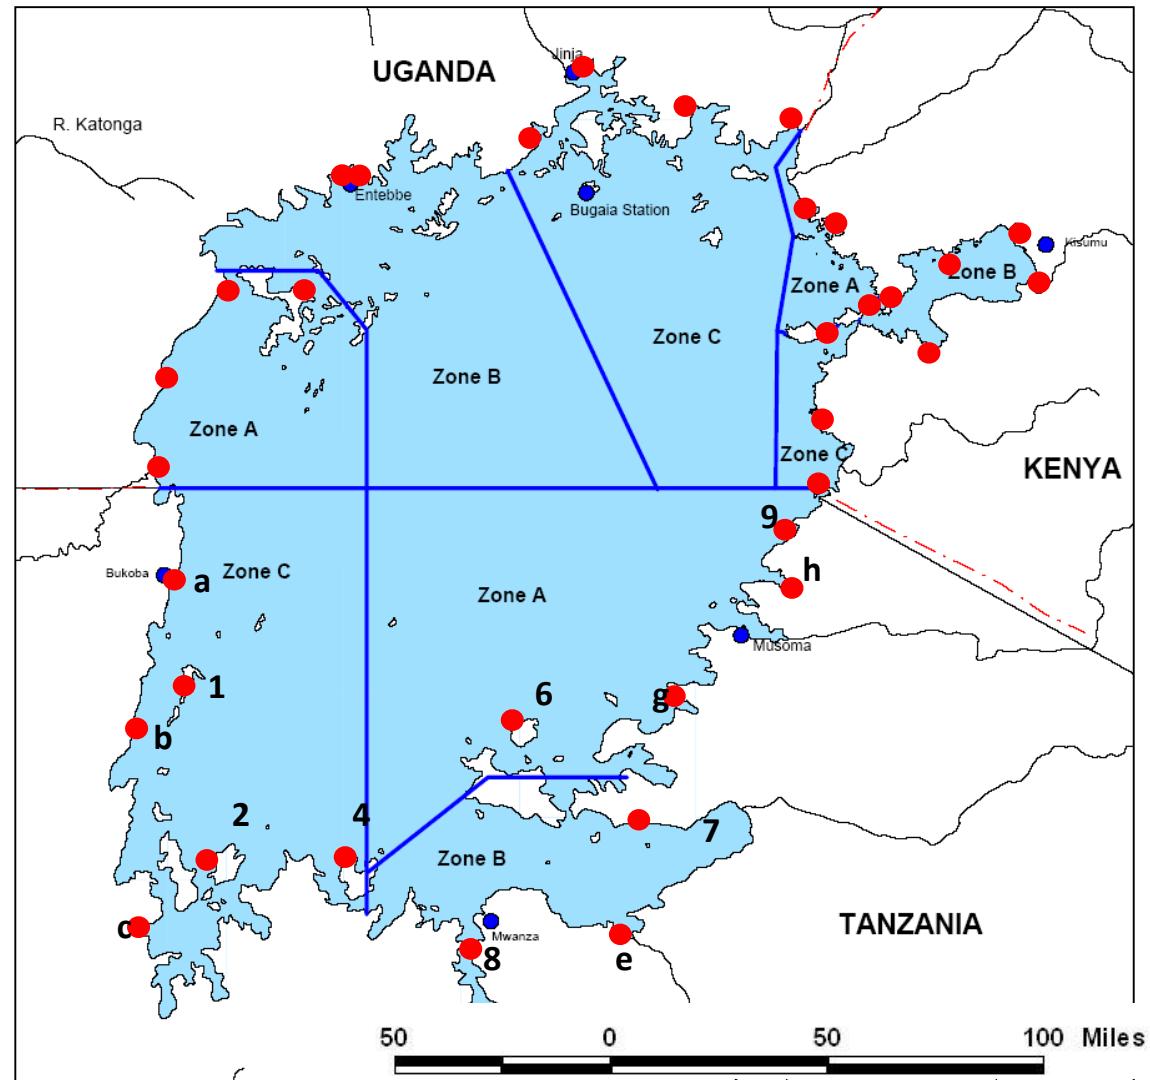

- the geographical distribution of species **WITHIN** Lake Vic
- the spatial turnover of diversity **WITHIN** Lake Vic
- the true number of endemic species
- the true number of extinct species
- The effect of cichlid diversity on ecosystem function and ecosystem services

# Needed: geo mapping of within-lake diversity at the species level

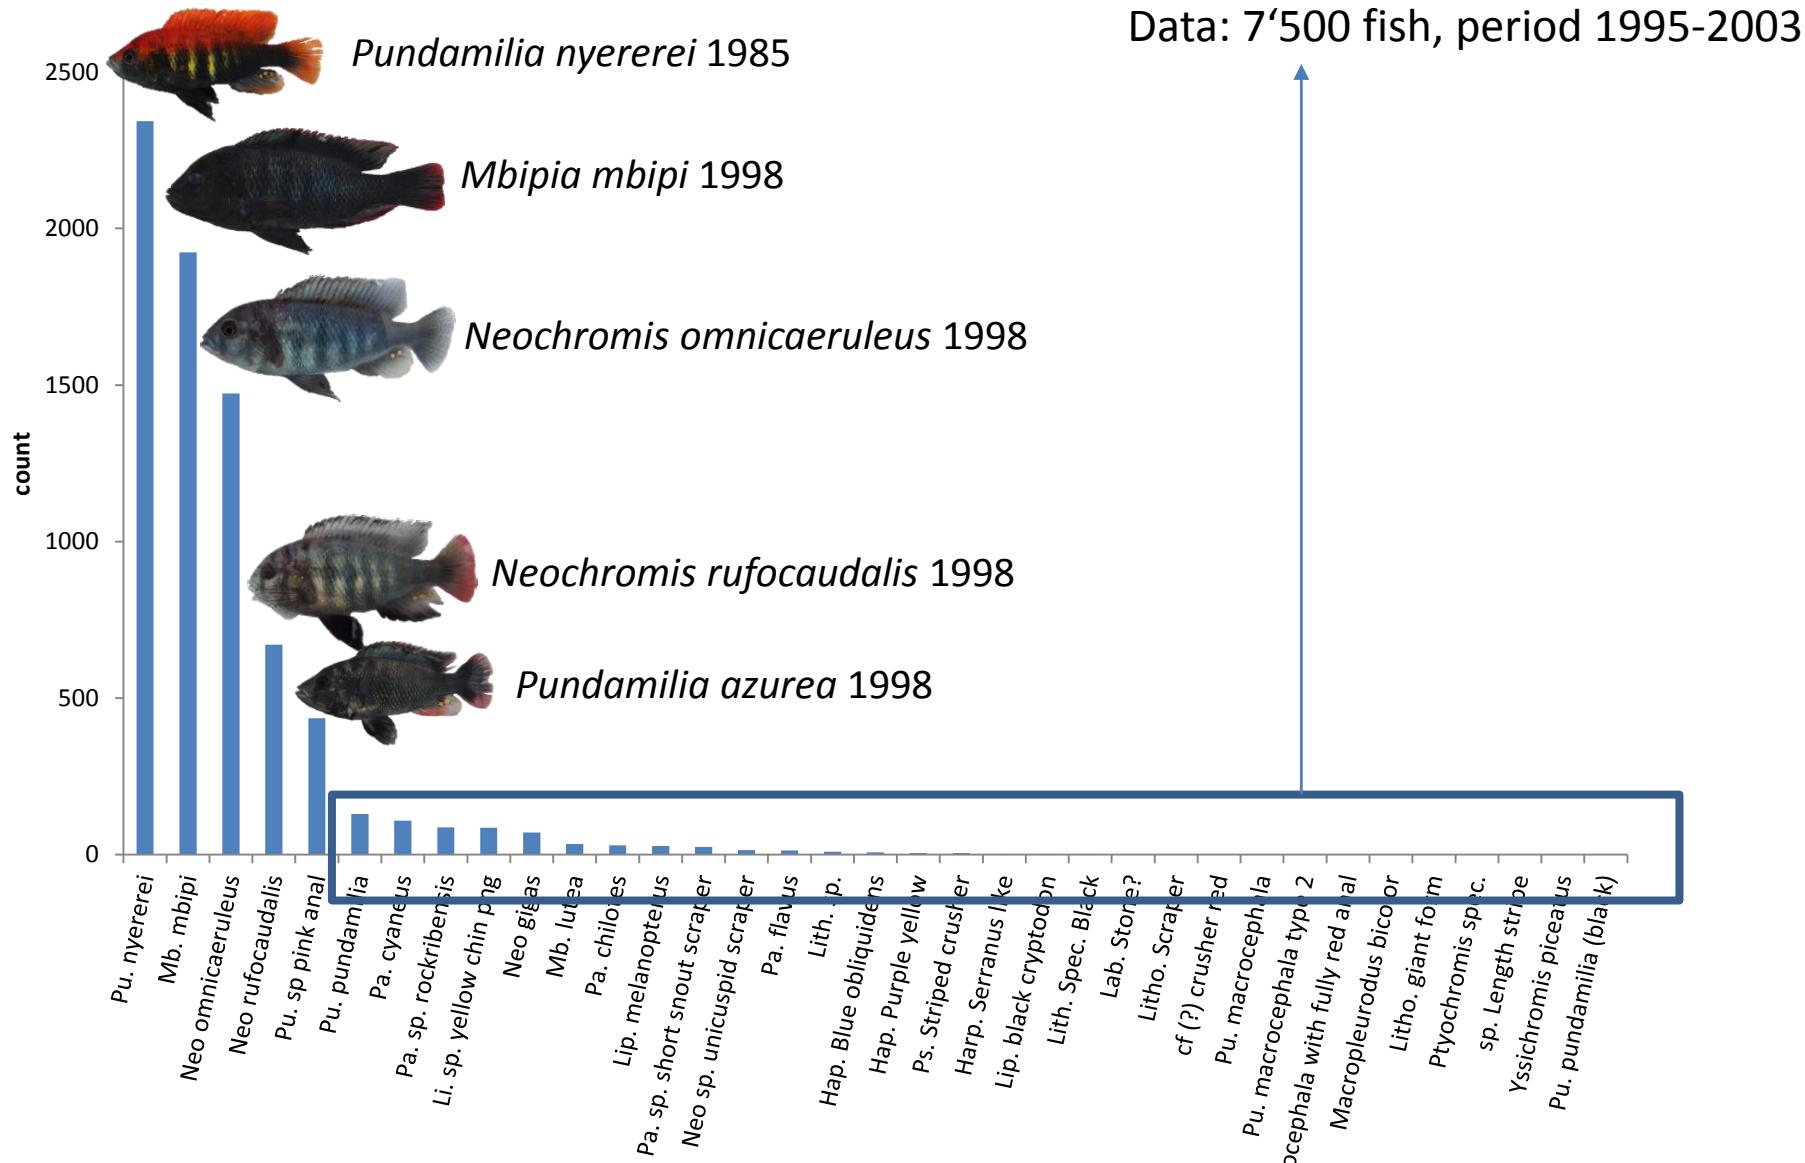

- lake-wide data on the distribution of individual species and alpha diversity
- A better understanding of the rate and extent of geographical turnover of diversity WITHIN Lake Victoria (beta, gamma div)

- Key Biodiversity Areas, key regions for conservation, key species and species groups
- The role of diversity in the food web and ecosystem

# Major challenges in species rich systems: Difficult taxonomy, uneven abundances

# Hope ... «people are the solution»
