

**INTEGRATED RIVER-BASIN MODELLING
AS A TOOL for WATER MANAGEMENT
in the SCOPE of the WFD**

J. SMITZ

University of Liège, Belgium

j.smitz@ulg.ac.be

EURO INBO 2005, Namur, 29 – 30 SEPTEMBER 2005

Models & the implementation of the WFD

WFD :

- What are the effects of driving forces and pressures ?
- What is the impact ?
- What is the risk of not achieving the good status ?

Some utilisations of the PEGASE model in the scope of the implementation of the WFD

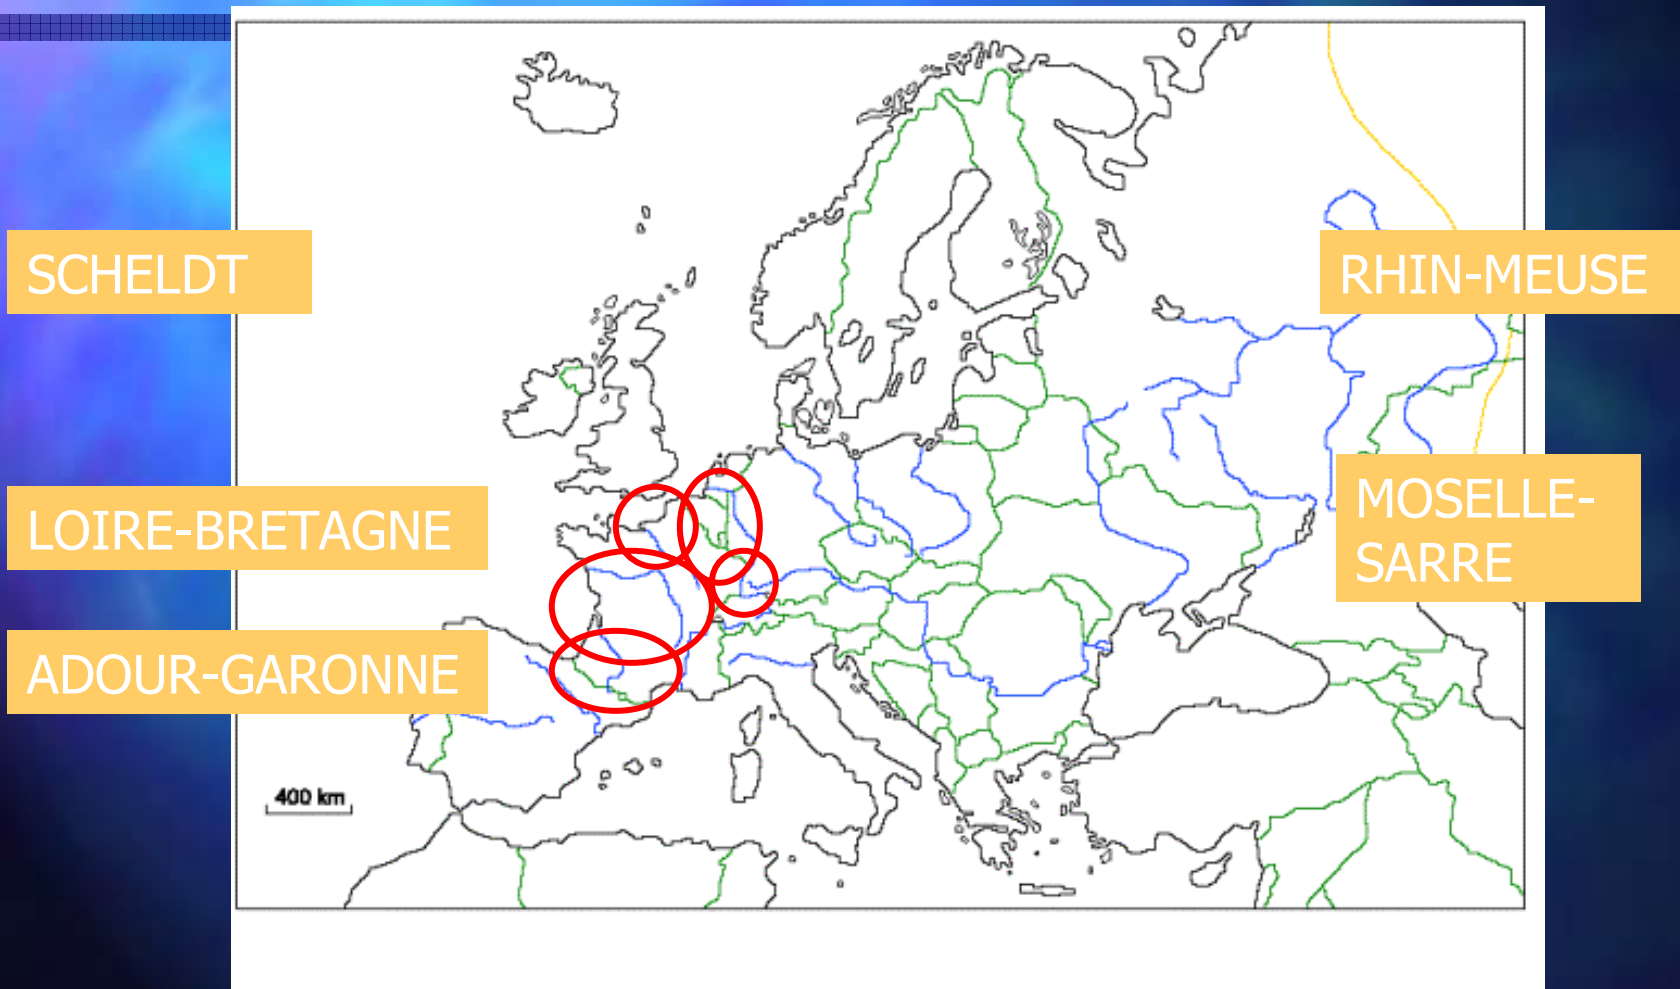

realized by / in collaboration with > 8 Water Agencies

- Ministry of Environment, Région wallonne, Belgium
- Flanders Environment Agency, Belgium
- Rhin-Meuse Water Agency, France
- Artois-Picardie Water Agency, France
- Loire-Bretagne Water Agency, France
- Adour-Garonne Water Agency, France
- Water Administration, Luxemburg
- Saarland & Rhine-Palatine
Environment Agencies, Germany
- several local Water Authorities

Some utilisations of the PEGASE model in the scope of the implementation of the WFD

The PEGASE model

PEGASE = Planification Et Gestion de l'Assainissement des Eaux

Inputs

Basins
Land use

Hydrographic
network

Hydro-meteo

Driving forces /
Pressures

PEGASE
model

Outputs / results

Pollutant loads to
the river network

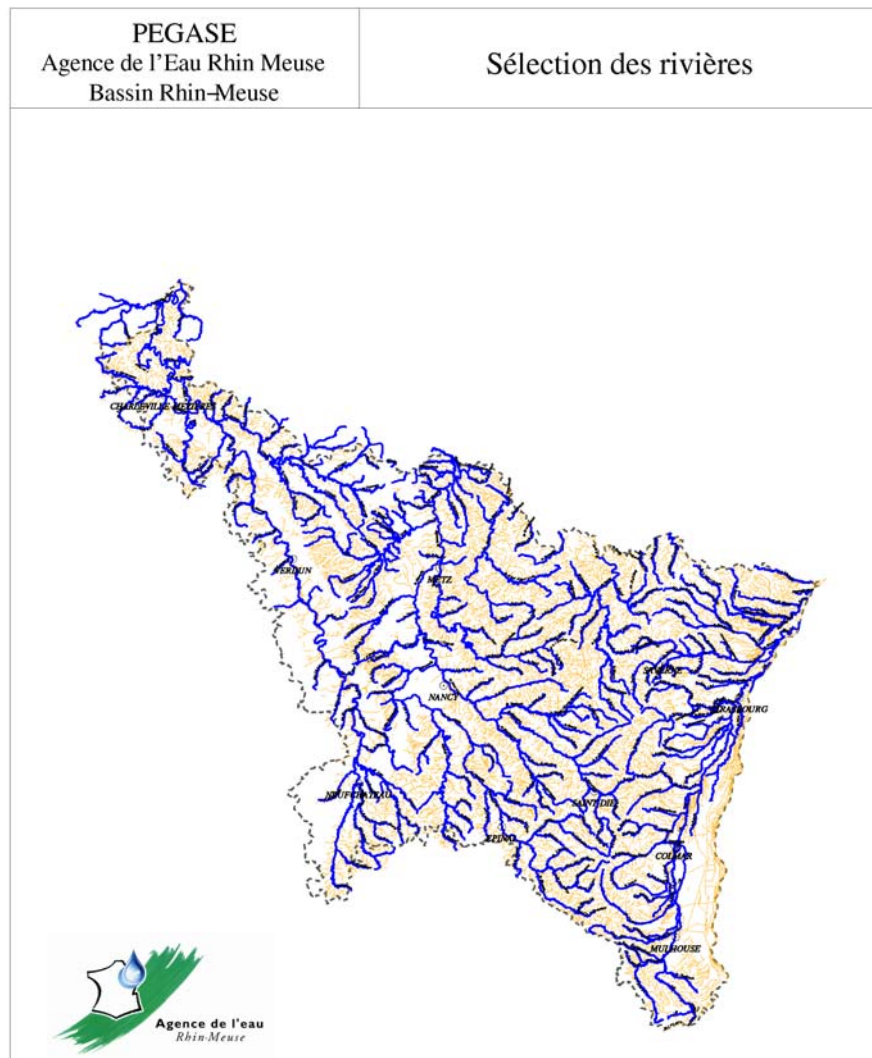

River flow & veloc.
Water temperature

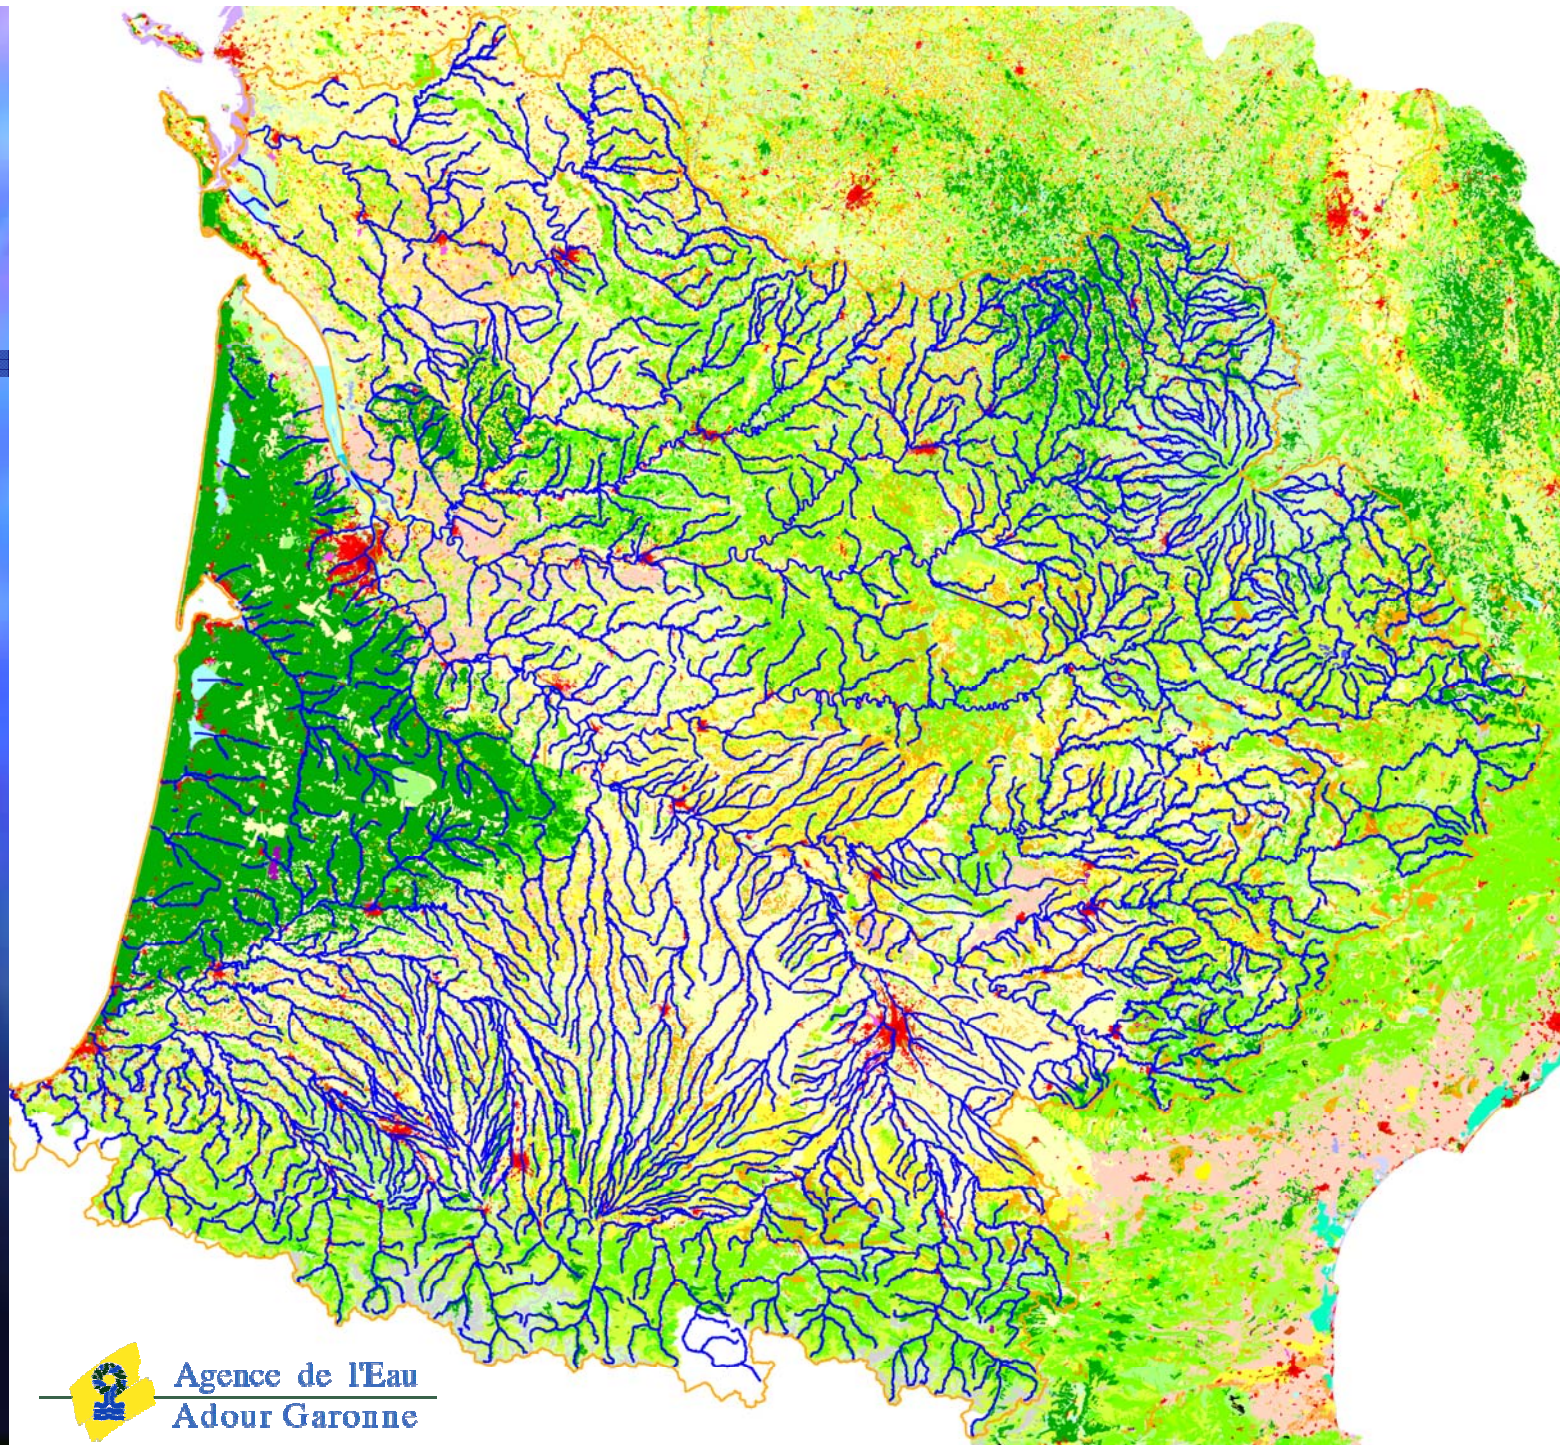

Biomasses
Ecosystem activity

Water quality
Fluxes

Input data : geo- & hydrological referential

- DTM, land use, river network
- Selection of rivers that are included explicitly in the model

Agence de l'Eau
Adour Garonne

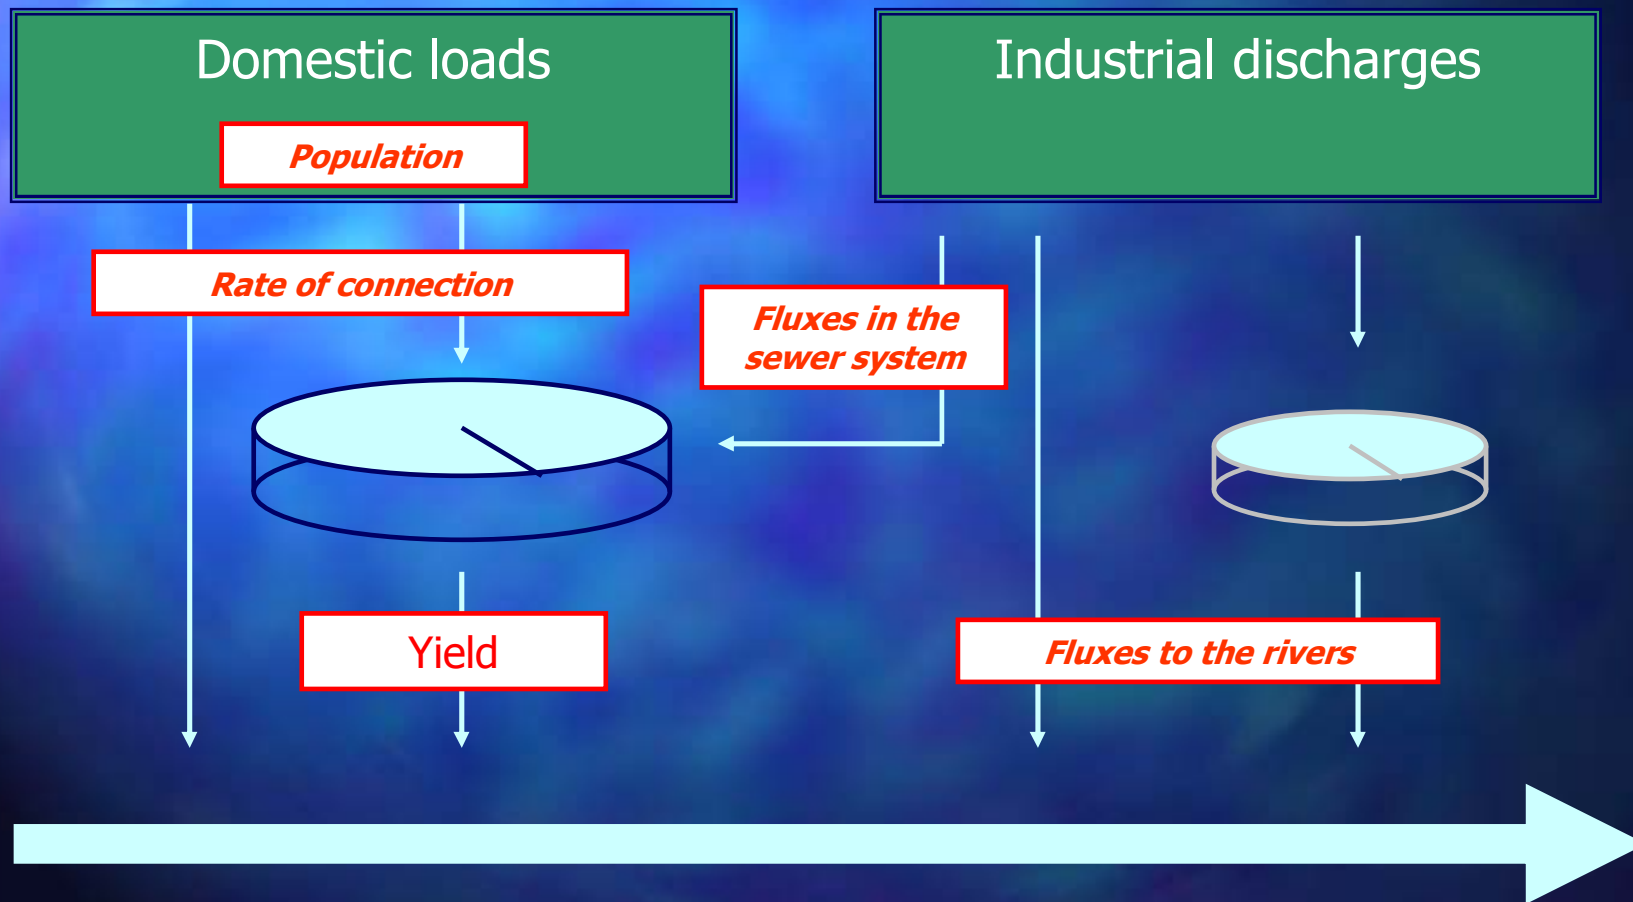

LE BASSIN LOIRE-BRETAGNE

Délimitation des principaux bassins hydrographiques

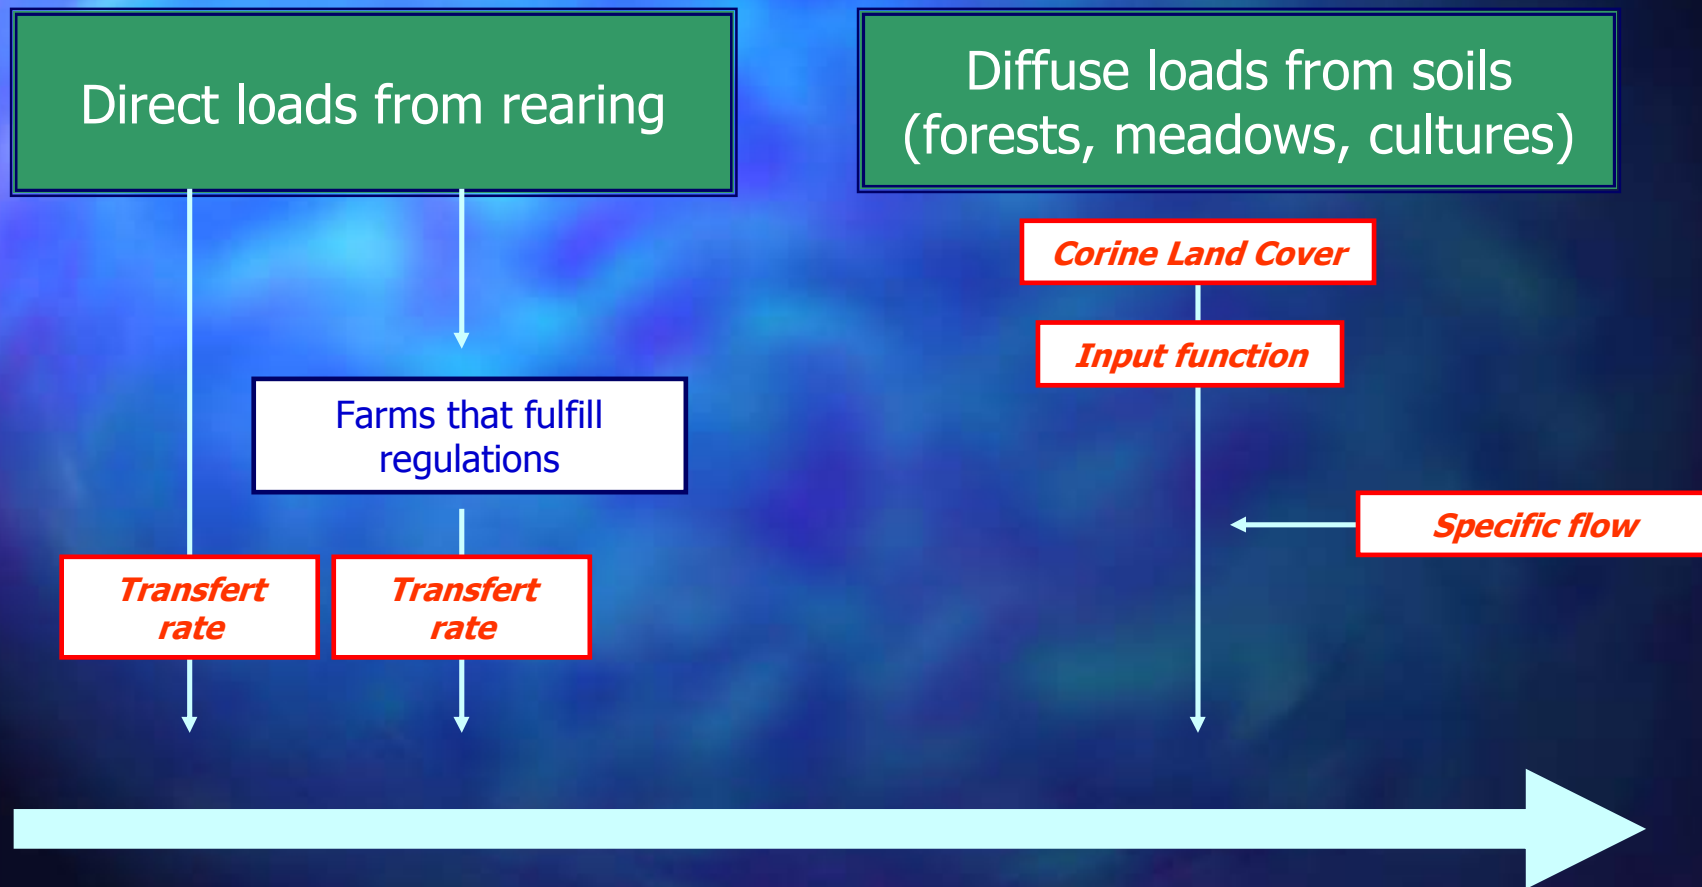

Input data : point discharges

- Domestic loads (population) + industrial discharges
- Connections to sewer systems and purification plants

Diffuse loads : calculation of :

- Diffuse loads from soils : statistical functions (emission factors) depending on soil type and land use (forest, meadow, culture)
- Direct loads from rearing (bovine, porcine, ... populations)

Diffuse loads

PEGASE : calculations

- Calculation of the loads and discharges to the river network
- Calculation of the hydrological / hydraulic variables
- Calculation of ecosystem and water quality variables :
 - The processes that are included are :
 - . Physico-chemical processes
 - . Primary production : phytoplankton, phytobenthos
 - . Grazing : zooplankton
 - . Organic matter degradation by bacteria (planctonic, biofilm, benthic)
 - . Nitrification, denitrification
 - . Oxygen productions and consumptions
 - . Nutrient cycling processes

PEGASE : results

Non-stationnary (dynamic) simulation of :

- Flows, depths, velocities, ... in the river network ($\Delta x \sim 300$ m)
- Ecosystem and water quality variables (daily / hourly) :
 - . Biomasses
 - . Concentrations (BOD, COD, DOC, POC, N, P, D.Oxygen, ...)
 - . Fluxes
- Quality indexes (*Seq-Eau*) : scale 1 - 100

5 levels

good

very good

- Results : profiles (in space), evolutions (in time), maps, tables

The results can be calculated for each of the surface water bodies

PEGASE : utilisation in the scope of the WFD

THE SUCCESSIVE STEPS :

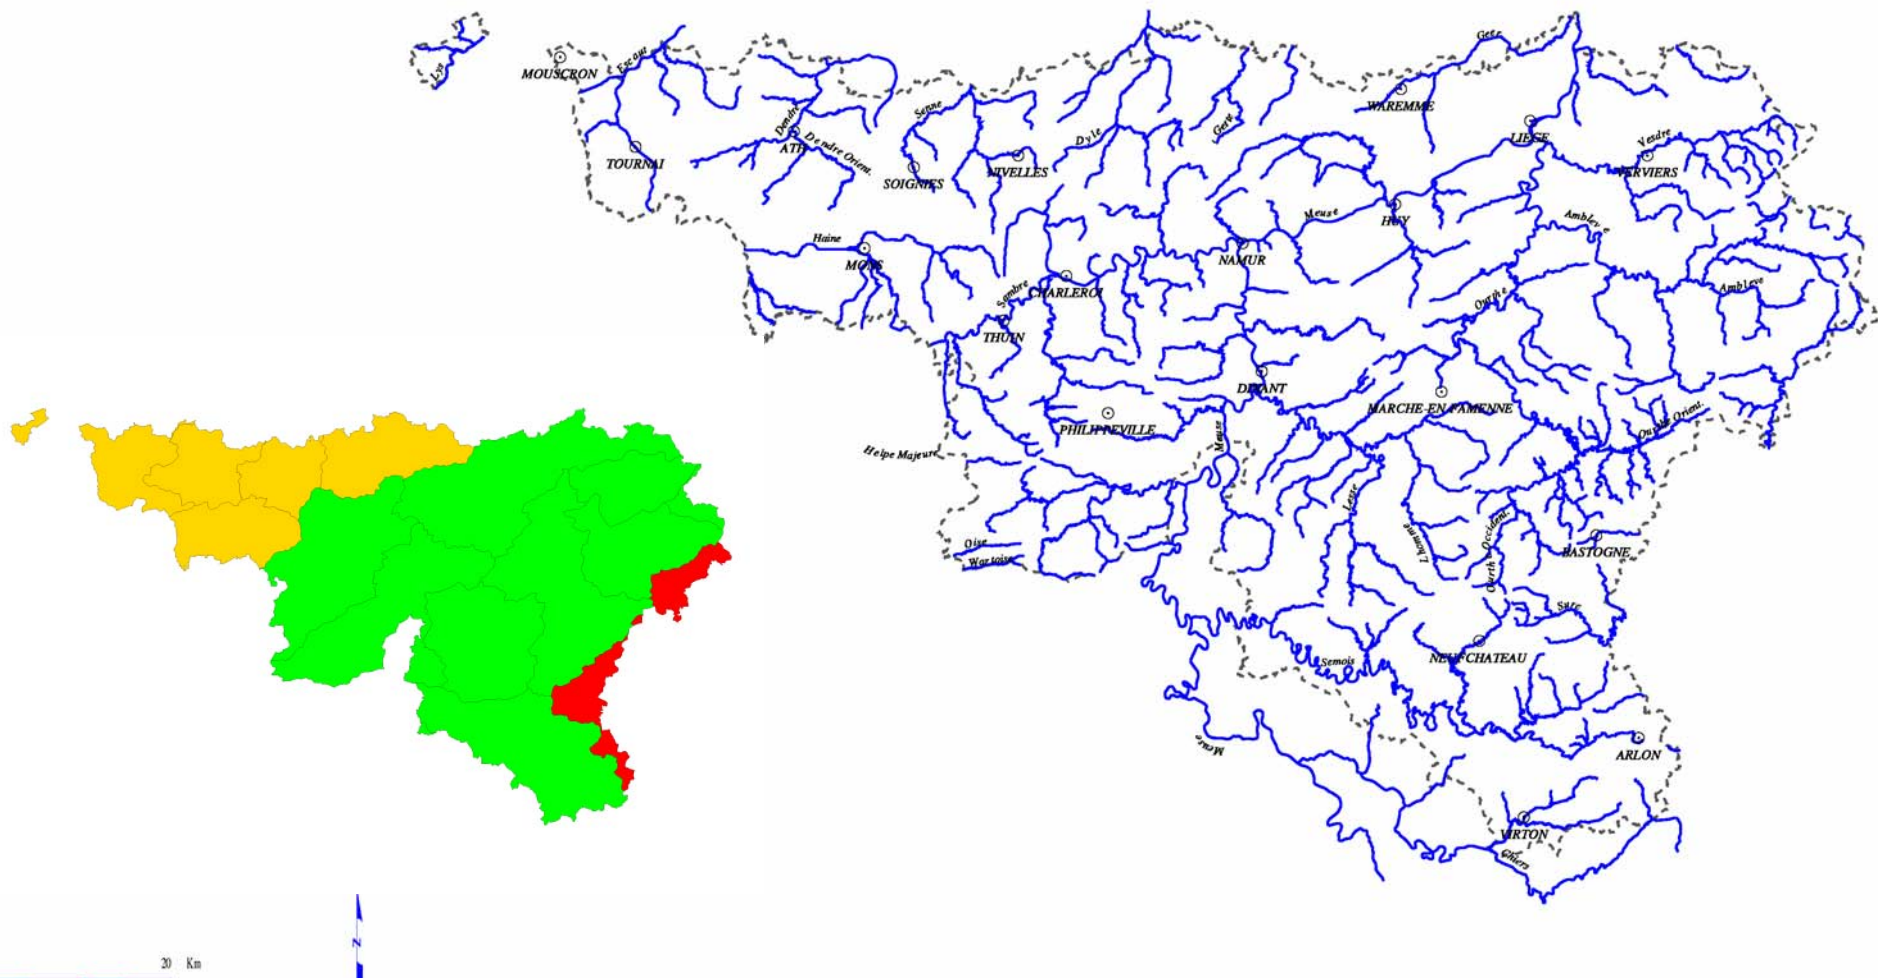

- 1) IMPLEMENTATION of the model in a basin (district)
Main characteristic of PEGASE : input = 'classical' data
 - 2) VALIDATION of the model : simulation of past/present situations
*Main characteristic of PEGASE :
very few or NO calibration needed (all processes are already calibrated)
calibration needed only for emission functions of diffuse loads*
 - 3) PRESSURE / IMPACT ANALYSIS (Art. 5 analysis)
Assessment of the impacts of domestic, industrial, diffuse loads
 - 4) SIMULATION OF SCENARIO'S (2015 scenario's)
Assessment of the **RISK** of failing to meet the GOOD STATUS
 - 5) SIMULATION OF ADDITIONAL MEASURES
=> preparation of the River Basin Management Plans (2009)
=> support for the public participation / consultation
 - 6) SUPPORT for the DESIGN of the MONITORING NETWORKS
-

In the scope of the PIRENE programme : new developments :

1) Modelling of the micro-pollutant concentrations

- Domestic discharges : Eq-InHab μ P
- Industrial discharges : inventory of discharges
- Direct discharge by the bovines / porcines
- Diffuse load from the soil : emission factors

- Calculation of concentrations in the water column :
 - in the dissolved phase (water)
 - in the particulate phase (solid particles)
- Calculation of sedimentation processes
- Calculation of adsorption / désorption processes water \Leftrightarrow solid particles

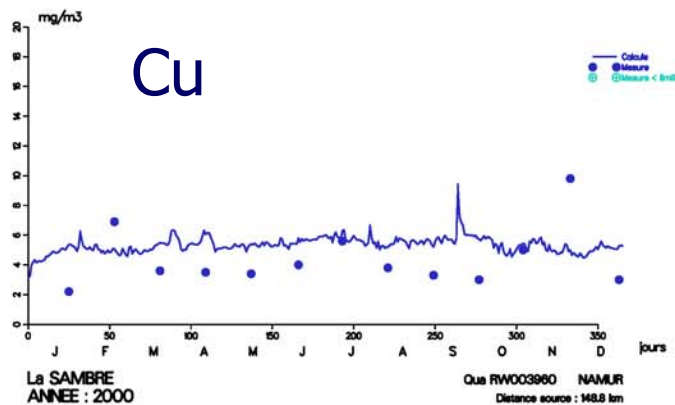

Tests have been made for : Cd, Cu, Zn, Pb
Cr, Ni, As, Hg

Concentration of μ Pollutants in the SAMBRE river – Year 2002

PIRENE programme (2000 – 2005)

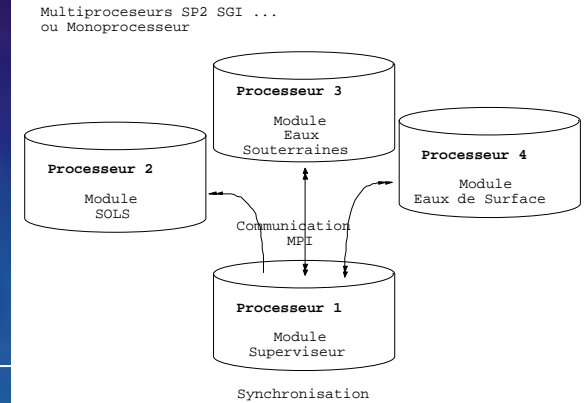

Full integrated modelling in the perspective of the WFD

- + Explicit (deterministic) modelling of SOILS
- + Explicit (deterministic) modelling of GROUNDWATER
- + Detailed (deterministic) modelling of the RIVER NETWORK
(incl. full hydrodynamic modelling)

PIRENE programme :

Full integrated modelling :
SOILS + GROUNDWATER + SURFACE WATERS

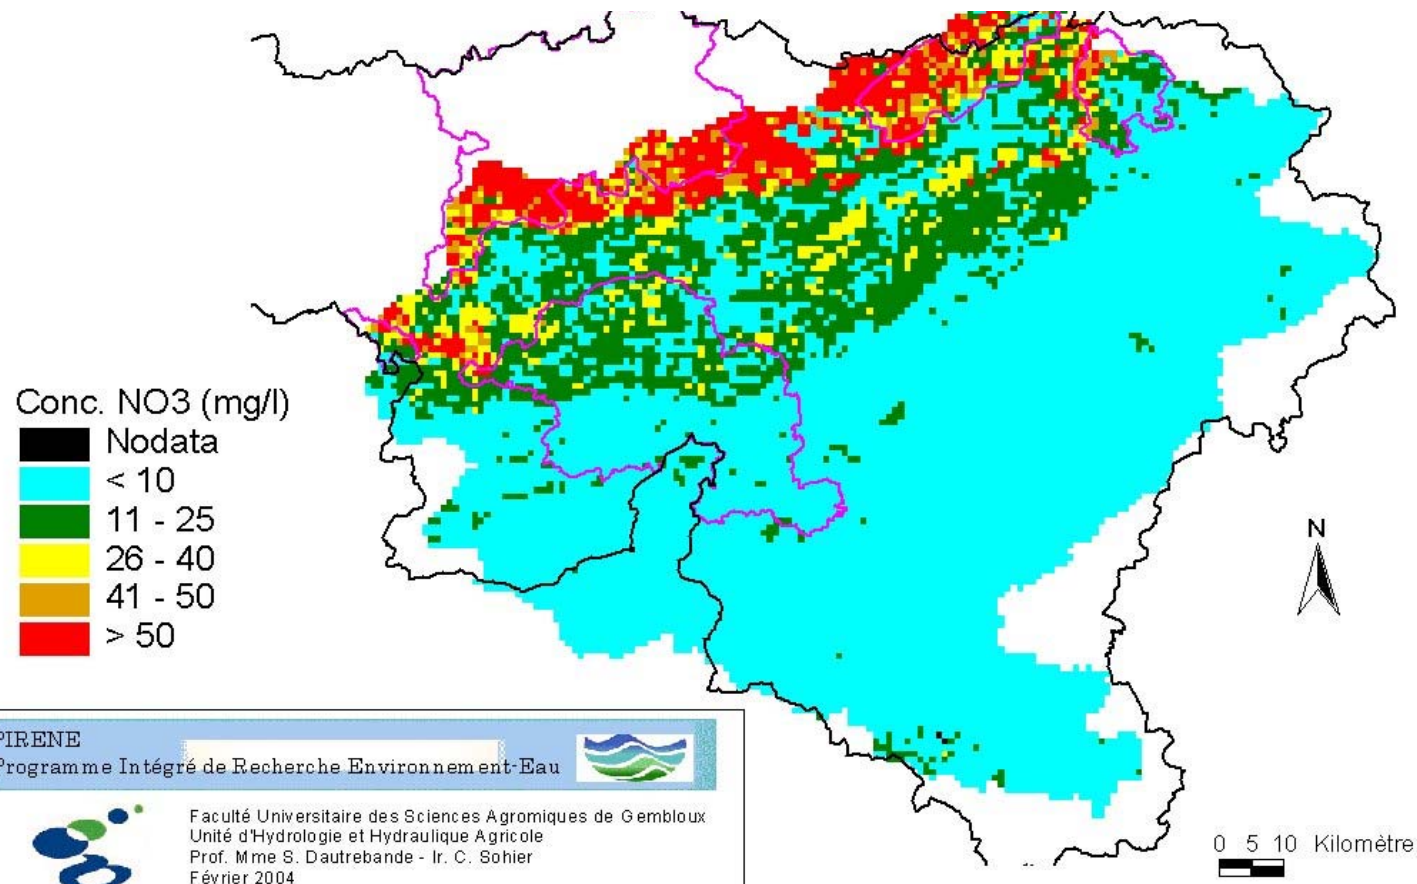

PIRENE programme :

Results of the soil sub-model (FUSAGx) :

Nitrate concentrations / bottom of the Non Saturated Zone Averaged value - Period 1998 - 2000

PIRENE programme : Results of the integrated model : Daily fluxes of nitrates from the SOILS and GROUNDWATER to the SURFACE WATERS

Basin of the SEMOIS at Membre (1.318 km²)

Daily fluxes of nitrates (kg N / day) to the river network
